## Summary

The 23<sup>rd</sup> round of the Interlaboratory Comparison on POPs in Food was conducted in 2022 by the Norwegian Institute of Public Health (NIPH). The study included the determination of the 2,3,7,8-chlorinated dibenzo-*p*-dioxins (PCDDs) and dibenzofurans (PCDFs), as well as dioxin-like non-ortho and mono-ortho chlorinated biphenyls (PCBs) in three different food items. Additionally, the participating laboratories could determine the concentrations of six indicator PCBs, polybrominated diphenyl ethers (PBDEs) and hexabromocyclododecanes (HBCDs) in the same food samples.

A fourth matrix was also accessible to the participants, designated for the determination of the following poly- and perfluoroalkyl substances (PFASs): Perfluorooctanesulfonate (PFOS), perfluorohexanesulfonate (PFHxS), perfluorooctanoate (PFOA), perfluorononanoate (PFNA), perfluorodecanoate (PFDA) and perfluoroundecanoate (PFUnDA).

The objectives of this interlaboratory comparison study were

- A. To offer a tool for quality assurance to the participating laboratories
- B. To assess the between laboratory reproducibility
- C. To assess the readiness of expert laboratories worldwide to determine levels of chlorinated and brominated persistent organic pollutants, as well as for PFASs, in regular foodstuffs.

With respect to PCDDs/PCDFs, non-ortho PCBs, mono-ortho PCBs, indicator PCBs, PBDEs and  $\alpha$ -HBCD, the 2022-round of the study was performed on unfortified homogenates of Veal, Halibut and Fish oil. An unfortified homogenate of fish was offered for the determination of PFASs.

If desired, the laboratories could also determine the concentrations of PCDDs/PCDFs, non-ortho PCBs, mono-ortho PCBs, indicator PCBs, PBDEs and  $\alpha$ -HBCD in standard solutions from Cambridge Isotope Laboratories, provided by NIPH.

The test materials were sent to 46 laboratories worldwide in February 2022, and results were returned from 45 of these.

Due to the ongoing corona-pandemic there has been some delays this year. A draft report would normally have been published in July, but due to the extended deadline for submitting results it was not made available on our webpage [www.fhi.no/ILC](http://www.fhi.no/ILC) until January 2023, and the deadline for commenting on the published results was set to February 15<sup>th</sup>, 2023.

This report presents the reported results for all seventeen 2,3,7,8-substituted PCDDs/PCDFs, the four non-ortho substituted PCBs #77, 81, 126 and 169 and the eight mono-ortho substituted PCBs #105, 114, 118, 123, 156, 157, 167, 189 in the three food items on a fresh weight and lipid weight basis.

The results of eight PBDEs #28, 47, 99, 100, 153, 154, 183 and 209, six indicator PCBs #28, 52, 101, 138, 153 and 180, and total HBCDs as well as the  $\alpha$ -,  $\beta$ - and  $\gamma$ -isomers are also presented.

The results of PFOS, PFHxS, PFOA, PFNA, PFDA and PFUnDA in a sample of Fish are also included.

The consensus concentration (assigned value) for each analyte in the four food samples was determined as follows: For the seventeen 2,3,7,8-substituted PCDDs/PCDFs, the four non-ortho substituted PCBs and the eight mono-ortho substituted PCBs non-detected congeners were assigned a concentration corresponding to the reported detection limits. The median of all reported concentrations for each analyte was then calculated. All values above twice the median was removed from the calculation. The consensus median and consensus mean as well as standard deviation (SD) were calculated from the remaining data, and this second median was called consensus value.

For the PBDEs, the indicator PCBs and HBCDs the non-detects were removed from the data set. The median of all reported concentrations for each analyte was then calculated. All values above twice the median were removed from the calculation. The consensus median (consensus value) and consensus mean as well as standard deviation (SD) were calculated from the remaining data.

When calculating the results for PFASs in the sample of Fish, we adopted the same approach as we used for the indicator PCBs and PBDEs.

Toxic equivalents (TEQs) were calculated from the consensus medians of individual congeners using the toxic equivalency factors derived by WHO 2006 (from 2012: WHO<sub>2006</sub>TEQs as opposed to WHO<sub>1998</sub>TEQs as in the reports published before 2012).

Z-scores for the PCDD/PCDF TEQs were calculated for each laboratory using  $\pm 20\%$  of the consensus TEQs as a value for target standard deviation ( $\sigma=0.2$ ), on both fresh weight and lipid weight basis. Further, Z-scores were calculated for the non-ortho PCB TEQ, the mono-ortho PCB TEQs, the total TEQ, the sum of six indicator PCBs, the sum of eight PBDEs, total HBCD, and the three isomers of HBCD and for each single congener in all three matrices of Veal, Halibut and Fish oil ( $\sigma=0.2$ ) (both on a fresh weight and a lipid weight basis). The z-scores for PFASs were calculated in the same way, but on fresh weight basis only.

The consensus values of the standard solutions were calculated as mentioned above except for the removal of all values exceeding  $\pm 50\%$  of the median prior to the final calculation of the consensus median and mean.

The consensus values for the lipid contents were calculated by first excluding results deviating more than two SD from the mean of all values, and then re-calculating the median, mean and SD.

The sample of Fish oil was the sample in this study with the highest total TEQ (3.3 pg TE/g fw, WHO<sub>2006</sub>TEFs). For this sample, Z-scores within  $\pm 1$  were obtained by 89 % of the participating laboratories, and Z-scores within  $\pm 2$  were achieved by 95 % of the participants (Z scores within  $\pm 1$  and  $\pm 2$ , corresponds to a trueness of  $\pm 20\%$  and  $\pm 40\%$ , respectively). The Fish oil -sample was followed by the sample of Veal, with a consensus

total TEQ of 0.62 pg TE/g fw (WHO<sub>2006</sub>TEFs). For this sample 75 % of the participants achieved Z-scores within  $\pm 1$ , and 88 % achieved Z-scores within  $\pm 2$ .

For the sample of Halibut, which on beforehand was assumed to be the sample with lowest level of contamination (total TEQ=0.48 pg TE/g, WHO<sub>2006</sub>TEFs, fresh weight), Z-scores within  $\pm 1$  were obtained by 59 % of the reporting participants on fresh weight basis, and Z-scores within  $\pm 2$  was achieved by 88 % of the participants.

The relative standard deviation (RSD) calculated for the total TEQ after removal of outliers was 11% for the sample that had the highest levels of contamination (Fish oil). For the lower contaminated Veal and Halibut-sample, the corresponding RSD was 15 and 18 %. Considering the levels of contamination in the three food samples in this study, it may be concluded that the abilities and performance of laboratories worldwide in determining dioxin-like compounds is generally good.

For the food samples, 29-36 laboratories reported results for the six indicator PCBs. The total consensus concentrations on fresh weight basis for six indicator PCBs were 3470 pg/g (18 %) in Veal, 3752 pg/g (16 %) in Halibut and 17992 pg/g (11 %) in Fish oil, with total RSDs given in parentheses.

13-19 laboratories reported concentrations for all seven of the tetra- to hepta-PBDEs and 10-13 laboratories reported concentrations for PBDE-209. The consensus concentrations of the sum of the PBDEs with PBDE-209 excluded, were on fresh weight basis 66 (20 %), 300 (26 %) and 1377 (19 %) pg/g in Veal, Halibut and Fish oil, respectively, with total RSDs given in parentheses. The consensus concentrations for PBDE-209 were 5.0 (n=10, RSD=72 %), 6.5 (n=13, RSD=84 %) and 54 (n=11, RSD=81 %) pg/g fresh weight in Veal, Halibut and Fish oil, respectively.

The consensus concentrations calculated for HBCDs are indicative, as only a few laboratories reported results (n=4-7).

14-16 laboratories reported results for the different PFASs in the sample of Fish. The sample was known to be contaminated with PFOS (consensus concentration 42000 pg/g fw). Eighty-eight percent of the participants obtained a Z-score  $\pm 2$  for PFOS, and 69 % obtained Z-scores  $\leq 1$ . For PFDA (consensus concentration 293 pg/g fw), 43 % of the participants obtained z-scores  $\leq 1$ , and for PFUnDA (consensus concentration was 417 pg/g fw) 36 % obtained z-scores  $\leq 1$ .

The consensus values for PFHxS, PFOA and PFNA are indicative due to few reported results (many NDs).

## Introduction

Maximum residue limits and official food control systems are established in many countries for the monitoring of levels of dioxins and dioxin-like PCBs in food and feed, both to map and to reduce human and animal exposure to these highly toxic pollutants. For the same reasons, the European Union introduced levels of legislation in 2014 for the indicator PCBs as well. New tolerable intakes for dioxins were introduced by EFSA in 2018 and for PFASs, tolerable weekly intakes for PFASs (more specifically; PFOS, PFOA, PFHxS and PFNA) were established in 2020. To meet these requirements, there is a large demand for chemical analytical laboratories with the skills and abilities to determine these contaminants at very low concentrations and in complex matrixes.

Additionally, it is usually required by the authorities that laboratories performing such measurements are accredited according to ISO standards and prove their competence by successful participation in interlaboratory studies.

This is the 23<sup>rd</sup> round of the world-wide interlaboratory comparison study on dioxin-like compounds, eight PBDEs, six indicator PCBs and HBCD in food, organized by the Department of Food at the Norwegian Institute of Public Health (NIPH), Oslo, Norway. From 2019 a food sample designated for the determination of six selected PFASs was also added.

The main objective of this exercise is to assess the between laboratory reproducibility of dioxin-like compounds analyses in foods, and to provide a QA/QC instrument for each participating laboratory to contribute to its proficiency.

The exercise took place from February 2022, when the samples were shipped to the laboratories for analysis, until the reporting deadline in September 2022, when the last reports with results were received. A draft report was made available to the participants on our webpage (<http://www.fhi.no/ILC>) in January 2023.

All participants from previous rounds in this series of "Interlaboratory Comparisons on POPs in Food" were invited to participate. In addition, several other laboratories announced their interest and were invited to participate. There was no limit to the total number of participating laboratories. The 45 laboratories that submitted results, and thereby contributed to the study results, are presented in Table 1.

## Design and practical implementation

### **Study design and reporting of results: PCDDs/PCDFs, non-ortho substituted PCBs, mono-ortho substituted PCBs, indicator PCBs, PBDEs and HBCDs**

As in the previous rounds of this interlaboratory comparison study, the test material chosen represented naturally contaminated food items. The analytes to be determined were all seventeen 2,3,7,8-substituted PCDDs/PCDFs, the four non-ortho substituted PCBs #77, 81, 126 and 169 and the eight mono-ortho substituted PCBs #105, 114, 118, 123, 156, 157, 167 and 189. If desired, the laboratories could also determine eight PBDEs #28, 47, 99, 100, 153, 154, 183 and 209, six indicator PCBs #28, 52, 101, 138, 153 and 180, total HBCD and its three isomers ( $\alpha$ -,  $\beta$ -,  $\gamma$ -HBCD). The six PCB congeners belong together with the mono-ortho PCB #118 to the selection of PCBs commonly referred to as ICES-7 (ICES-7: Report of the ICES Advisory Committee, 2010; Book 7).

The analysis should be performed using the laboratories' own methods for sample preparation and instrumental analysis, their own quantification standards and quantification procedures, and their own method for lipid determination.

It was recommended that laboratories determined as many as possible of the 2,3,7,8-substituted PCDDs/PCDFs, dioxin-like PCBs, PBDEs, indicator PCBs and HBCD in the samples of Veal, Halibut and Fish oil.

The laboratories were to report the concentration of each detected congener (e.g. S/N  $\geq 3$ ) in the food items on fresh weight basis, as well as the limit of detection (LOD, e.g. S/N = 3). Non-detected congeners (e.g., S/N < 3) were to be marked "ND" in the comments-column of the Report forms. As the report was to include the determination of lipid percent in the food samples, the laboratories should also include the determined lipid percentage of the samples as well as sample amount used for the analysis.

In addition to the food samples, six standard solutions containing known concentrations of the analytes could be analyzed, using the laboratories' own quantification standards and methods. The provided standard solutions consisted of the following components:

- 1) Seventeen 2,3,7,8-substituted PCDDs/PCDFs (2:5:10 pg/ $\mu$ l for tetra:penta:hexa-hepta:octa chlorinated dibenzo-p-dioxins/-dibenzo furans respectively)
- 2) Four non-ortho PCBs (10 pg/ $\mu$ l)
- 3) Eight mono-ortho PCBs (100 pg/ $\mu$ l)
- 4) Eight PBDEs (100 pg/ $\mu$ l)
- 5) Six indicator PCBs (100 pg/ $\mu$ l)
- 6)  $\alpha$ -HBCD (500 pg/ $\mu$ l)

The test materials consisted of homogenates of Veal, Halibut and Fish oil. The laboratories could choose to analyze one, two or all three food samples.

## **Study design and reporting of results: PFASs**

For the 23<sup>rd</sup> round of the Norwegian POPs in Food-study, we also offered a food sample for the determination of the following PFASs: PFOS, PFHxS, PFOA, PFNA, PFDA and PFUnDA. The sample material consisted of Fish caught in an area well known to be contaminated by PFOS. As for the other matrices, the Fish sample was not fortified.

The laboratories' own methods for sample preparation and instrumental analysis, as well as their own quantification standards should be used for the analysis of the sample.

The laboratories were to report the concentration of each detected congener (e.g. S/N  $\geq 3$ ) in the Fish on fresh weight basis as well as the limit of detection (LOD, e.g., S/N = 3). Non-detected congeners (e.g. S/N < 3) were to be marked "ND" in the comment's column of the Report forms.

## **Confidentiality**

Each participating laboratory was given an exclusive laboratory code by the coordinators. In the present report, the participants are presented in the tables and figures by their unique codes. The participants have access to their own code only, and laboratory codes were not revealed to any third parties.

When received by the coordinators, the raw data from the laboratories were entered into a database. A draft report was generated and made available to all participants on the web page [www.fhi.no/ilc](http://www.fhi.no/ilc) in January 2023.

## **Collection, preparation, and distribution of samples**

Samples shipped to the participants consisted of one to four of the following:

- Veal (~100 g)
- Halibut Filet (~80 g)
- Fish oil (~50 g)
- Fish (~25 g)

The test materials were produced from natural products and were not fortified with standards.

The Veal was a kind donation from Dr.Ron Hoogenboom at the Wageningen University & Research. The Halibut-sample was made from Halibut fished along the coast along the north of Norway, and the Fish oil was a kind gift from Vedde AS, a Norwegian producer of fish oil. The Fish-sample was Perch from a lake in Sweden called Fysingen and given to us by the Department of Environmental Research and Monitoring at the Swedish Museum of Natural History, and mixed with fish-material known to be low contaminated by PFASs.

The Veal arrived as whole pieces of meat. The material was grinded, pooled, mixed and homogenized before distribution into sub-samples.

The Halibut arrived as whole fish. The fish were fileted, then pooled and grinded, and finally homogenized thoroughly.

The Fish oil arrived as one big frozen sample from the same production batch. At arrival to the Norwegian Institute of Public Health the oil was defrosted and homogenized by continuous stirring while it was heated gently.

The contaminated fish material arrived as whole, frozen fishes of Perch. The Perches were filleted before they were mixed with commercial available non-toxic fish-material, pooled and homogenized.

Sub-samples of at least 100 g of Veal (Veal-2022), 80 g of Halibut (Halibut-2022), 50 g of Fish oil (Fish oil-2022) and 25 g of Fish (Fish-2022) were placed into screw-cap polystyrene bottles. The bottles were all carefully washed, rinsed with methanol and dried before use. All samples were stored at -20 °C until shipment to the participating laboratories.

## **Statistical analysis**

As for previous rounds, this is the approach for the calculation of the consensus concentrations (assigned value) for each of the congeners included in the study:

For PCDDs/PCDFs and dioxin-like PCBs: Congener-by-congener medians were calculated from the food sample data of all reporting laboratories. The detection limits were used as concentration for non-detected congeners (upper bound concentration).

For PBDEs, indicator PCBs and HBCD: Non-detected congeners in the food samples were removed from the data set prior to consensus calculation. The same approach was used for the calculation of the PFASs.

Outliers for all congeners were defined as those values exceeding twice the median of all values and thus removed from the data set.

The consensus values were defined as the median of the remaining data for each congener. The consensus mean and SD were calculated from this data set for each congener. The congener data that were removed prior to consensus calculation are marked accordingly in the tables presenting the individual results.

For the standard solutions, outliers were defined as those values outside  $\pm 50\%$  of the median of all reported values and were removed from the data set before the calculation of the median, mean and SD were calculated from the remaining data. The consensus of the lipid content was calculated as the mean after removal of values outside  $\pm 2 \times \text{SD}$ .

TEQs were calculated from the consensus medians for PCDDs/PCDFs, non-ortho PCBs, and mono-ortho PCBs, using the toxic equivalency factors derived by WHO in 1998 and 2006. As the detection limit was used for the concentration of non-detects, these TEQs represent upper bound concentrations.

Z-scores on both fresh weight and lipid weight basis for PCDD/PCDF TEQ as well as for the non-ortho PCB TEQ, the mono-ortho PCB TEQ, the total TEQ (WHO<sub>2006</sub>TEFs), the sum of six indicator PCBs, the sum of eight PBDEs, total HBCD and for each congener were calculated for each laboratory according to the following equation:

$$Z = (x - X)/\sigma$$

Where  $x$  = reported value;  $X$  = consensus value (assigned value);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 0.2 multiplied by the consensus value was used, i.e. Z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

## **The final report and certificate**

The draft of the final report was prepared by the coordinators and published electronically in January 2023.

The final report will be made available to the participants in pdf format at [www.fhi.no/ILC](http://www.fhi.no/ILC).

A certificate of participation, stating the participant's laboratory code, will be sent to each participating laboratory who has contributed to the results by the end of March 2023.

## **Coordination**

The study was initiated and carried out by the Department of Food Safety, Norwegian Institute of Public Health, Oslo, Norway. Members of the coordination committee were:

Mahin Karimi, Senior Engineer  
[mahin.karimi@fhi.no](mailto:mahin.karimi@fhi.no)

Cathrine Thomsen, Department Director  
[cathrine.thomsen@fhi.no](mailto:cathrine.thomsen@fhi.no)

## Results

### Presentation in the report

Forty-five laboratories worldwide submitted their results within the deadline and the results are presented in the following chapters. All participating laboratories will be able to compare their own performance, congener by congener, with the other laboratories. Since variations in performances are based on several factors, it is recommended that each laboratory carefully evaluate the factors that, favorably or unfavorably, may have contributed to its performance.

Readers of the report can without being participants in the study or without access to laboratory codes, get a general overview of the analytical performance of laboratories worldwide on the determination on dioxins, dioxin-like PCBs, indicator PCBs, PBDEs, HBCD and PFAS in regular foodstuffs.

In Appendix E the consensus statistics are given on fresh and lipid weight basis for concentrations of individual congeners and TEQ values, a summary of TEQ values for each food item, and the Z-score plots on both fresh and lipid weight basis, based on a target deviation of  $\pm 20\%$  from the consensus TEQ<sub>2006</sub>-values.

Individual results reported by the laboratories for each congener are given for Veal, Halibut and Fish oil in Appendix 2, 3 and 4. The results for PFAS in the sample of Fish are presented in Appendix 5, and results of the lipid determinations are presented in Appendix 6.

### Summarizing comments on results

#### *PCDDs/PCDFs*

##### **Analyte solution-2022**

Concentrations of PCDDs/PCDFs were reported by 36 laboratories. The average RSD for the 17 congeners was 6.7 % ranging from 5.6 % for 2,3,7,8-TCDD to 9.5 % for 1,2,3,4,7,8-HxCDD. The calculation of Z-scores for the TEQs (target 12.5 pg TEQ/ $\mu$ L based on TEF<sub>2006</sub>-values) of the PCDD/PCDF standard solution showed that 100 % of the laboratories were within the range of  $\pm 20\%$  of the consensus value. This clearly demonstrates that the calibration solutions used by the laboratories generally are of high quality.

##### **Veal-2022**

For the sample of Veal, PCDD/PCDF results from 31-32 laboratories were received. From these results, the calculated consensus TEQ (PCDD/PCDF TEQ based on WHO<sub>2006</sub>-TEFs) was 0.31 pg TE/g fresh weight and 6.1 pg TE/g lipid weight.

The average RSD was 38 %, ranging from 27-48 % for 2,3,4,7,8-PeCDF and 1,2,3,7,8,9-HxCDF respectively. Z-scores for the TEQs within  $\pm 1$  were obtained by 72 % of the laboratories and 91 % of the laboratories had Z-scores within  $\pm 2$  (fresh weight basis).

## **Halibut-2022**

PCDD/PCDF concentrations in the Halibut sample were reported by 41 laboratories. The consensus TEQ was 0.13 pg TEQ/g fresh weight, and 2.5 pg TEQ/g lipid weight (PCDD/PCDF TEQ based on WHO<sub>2006</sub>TEFs). The average RSD was 32 % ranging from 26-68 % (2,3,7,8-TCDF and 1,2,3,4,6,7,8,9-OCDF respectively). Z-scores were within ±1 for 63 % of the laboratories and within ±2 for 78 % of the laboratories (fresh weight basis).

## **Fish oil-2022**

PCDD/PCDF concentrations in the sample of Fish oil were determined by 36-37 laboratories. The consensus TEQ for PCDD/PCDF based on WHO<sub>2006</sub>TEFs was 3.3 pg TEQ/g both on fresh weight and lipid weight basis (PCDD/PCDF TEQ based on WHO<sub>2006</sub>TEFs). The average RSD was 38 % ranging from 17-64 % (2,3,4,7,8-PeCDF and 1,2,3,7,8,9-HxCDF respectively). Z-scores for PCDD/PCDF TEQ within ±1 were obtained by 81 % of the laboratories and 86 % had Z-scores within ±2 (fresh weight basis).

## *Dioxin-like PCBs*

### **Analyte solution-2022**

The 12 dioxin-like PCBs in the analyte solution were analyzed and reported by 35-36 laboratories. The RSDs for the different congeners were ranging from 4.8 % for PCB-156 to 6.8 % for PCB-118, with an average of 5.7 %.

## **Veal-2022**

Dioxin-like PCB concentrations in the sample of Veal were reported from 32 laboratories. The concentrations of the 12 congeners varied between 0.074 pg/g fresh weight (PCB-81) and 156 pg/g fresh weight (PCB-118). The average RSD for concentrations of individual dioxin-like PCB congeners was 37 % ranging from 34 % for PCB-157 to 45 % for PCB-123.

The dioxin-like PCBs contribute 50 % to the total TEQ (WHO TEF<sub>2006</sub>) in the sample with PCB-126 as the main contributor (44 %).

## **Halibut-2022**

Of the participating laboratories, 41 measured and reported dioxin-like PCB concentrations in the Halibut sample. The concentrations ranged from 0.32 pg/g fresh weight for PCB-81 to 550 pg/g fresh weight for PCB-118. The average RSD for concentrations of individual dioxin-like PCB congeners on fresh weight basis was 32 % ranging from 26 % for PCB-114 to 46 % for PCB-123.

The dioxin-like PCBs contribute to about 73 % of the total TEQ in the sample with PCB-126 as the main contributor (63 %).

## **Fish oil-2022**

Dioxin-like PCBs in Fish oil were reported by 37 laboratories. Levels were ranging from 1.5 pg/g fresh weigh for PCB-81 to 2890 pg/g fresh weight for PCB-118. The average RSD for concentrations of individual dioxin-like PCB congeners on fresh weight basis was 26 % ranging from 21 % for PCB-118 to 41 % for PCB-123.

The contribution of the dioxin-like PCBs to the total TEQ was about 59 % with PCB-126 as the main contributor (50 % of total TEQ).

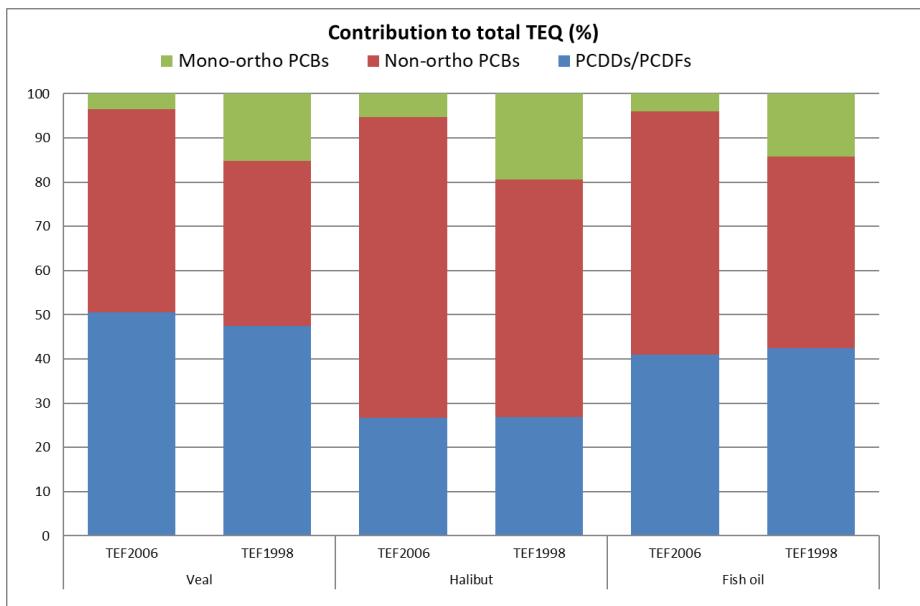

### Total TEQ

The total TEQ for the sample of Veal was 0.62 pg TEQ/g fresh weight and 12 pg TEQ/g lipid weight (WHO TEF<sub>2006</sub>). The total TEQ of the Halibut-sample was 0.48 pg TEQ/g fresh weight and 9.2 pg TEQ/g lipid weight, and the Fish oil contained 3.3 pg TEQ/g both on fresh weight basis and lipid weight basis.

The RSDs for total TEQs on fresh weight basis calculated from the RSD of individual congeners were 15 % for the sample of Veal, 18 % for Halibut and 11 % for Fish oil.

In Figure 1 the percentage contribution to the TEQ-values for the three groups of compounds is depicted based on WHO TEF<sub>2006</sub> and WHO TEF<sub>1998</sub>, respectively. For the selection of food-items included in this study the dioxin-like PCBs contributed from 49 % to 73 % to the total TEQ (using WHO TEF<sub>2006</sub>), demonstrating the variation in contribution, and the importance of the PCBs for the determination of the total TEQs related to the toxic potency of food samples.

**Figure 1. The percentage contribution of PCDDs/PCDFs, non-ortho PCBs and mono-ortho PCBs to the total TEQ calculated using both the WHO<sub>2006</sub> TEFs and WHO<sub>1998</sub> TEFs, in the three food samples.**

## *Indicator PCBs*

### **Analyte solution-2022**

40 laboratories reported indicator PCBs in the analyte solution. The average RSD was 8.1 % ranging from 5.8 to 12 % (outliers removed).

### **Veal-2022**

For the sample of Veal, results for indicator PCBs were received from 29 laboratories. The consensus concentrations varied between 50 pg/g fresh weight (PCB-28) and 1600 pg/g fresh weight (PCB-153). The RSDs were ranging from 31 to 41 % for PCB-52 and PCB-28 respectively, with an average of 36 % for all indicator PCBs. The consensus median for the sum of indicator PCBs was 3470 pg/g fresh weight.

### **Halibut-2022**

Within the deadline, 36 laboratories reported results for indicator PCBs in the Halibut sample. The consensus concentrations ranged from 159 pg/g fresh weight (PCB-28) to 1260 pg/g fresh weight (PCB-153) with a consensus median for the sum of indicator PCBs of 3752 pg/g fresh weight. The average RSD was 34 %, ranging from 29 to 39 % for PCB-180 and PCB-153 respectively.

### **Fish oil-2022**

Results were obtained from 42 laboratories. The concentrations of indicator PCBs in Fish oil ranged from 2123 pg/g fresh weight (PCB-28) to 16552 pg/g (PCB-153) and the consensus median for the sum was 50614 pg/g fresh weight. The average RSD was 24 %, ranging from 19 to 29 % for PCB-52 and PCB-28 respectively.

## *PBDEs*

### **Analyte solution-2022**

The tri- to hepta-PBDE standard solution was analyzed by 19 laboratories and 16 laboratories reported values for PBDE-209. The RSDs were between 5.2-14 % for all congeners.

### **Veal-2022**

The PBDE concentrations in Veal were reported by 13-14 laboratories, except for PBDE-209 for which 10 results were received. The consensus concentrations were in the range of 0.24 pg/g fresh weight for PBDE-28 to 24 pg/g fresh weight for PBDE-47. The consensus concentration for PBDE-209 was 61 pg/g fresh weight. The sum of tri- to hepta-PBDEs was 66 pg/g fresh weight. The range of RSDs on fresh weight basis was 34-72 %, with an average of 48 % including PBDE-209.

### **Halibut-2022**

Within the deadline, 18-19 laboratories had reported results for tri- to hepta-PBDEs in Halibut and 13 laboratories had reported results for PBDE-209. The consensus concentrations varied between 1.2 pg/g fresh weight (PBDE-183) and 186 pg/g fresh weight (PBDE-47). The concentration for PBDE-209 was 6.5 pg/g fresh weight. The sum of tri- to hepta-PBDEs was 300 pg/g fresh weight. The RSD calculated from the concentrations on fresh weight ranged from 35-45 %, with an average of 48 % for PBDEs including PBDE-209.

## Fish oil-2022

14-15 laboratories reported results for tri- to hepta-PBDEs in Fish oil, and 11 reported results for PBDE-209. The concentrations varied between 3.0 pg/g fresh weight (PBDE-183) and 861 pg/g (PBDE-47). The concentration for PBDE-209 was 54 pg/g. The sum of tri- to hepta-PBDEs was 1430 pg/g fresh weight. The RSDs for the individual congeners were ranging from 31 to 40 % with an average of 41 % including PBDE-209.

## HBCD

Also, in this round of the study, total HBCD and the isomers α-, β- and γ-HBCD could be determined and reported. A total of 6 laboratories reported α-HBCD in the standard solution and 3-6 laboratories reported one or more of the three isomers in the food samples. The consensus concentrations for the sum of individual HBCD isomers were 16 pg/g fresh weight for the sample of Veal, 68 pg/g for the Halibut and 610 pg/g fresh weight for the Fish oil sample. Since only a few laboratories reported HBCD, these results must be regarded as indicative values.

## PFASs

A sample of Fish known to be contaminated with PFOS, was offered to the participants for the determination of PFASs. The participating laboratories were asked to report their results for as many as possible of the following PFASs: PFOS, PFHxS, PFOA, PFNA, PFDA and PFUnDA. Sixteen laboratories reported their results by the deadline, but not all participants reported results for all PFASs. The consensus concentration of the sum of individual PFASs was 42917 pg/g fresh weight, with PFOS as the main contributor (42000 pg/g fw, n=16). The concentration of PFUnDA in the sample was 417 pg/g fw, while the concentration of PFDA was 293 pg/g fw. The consensus values for PFHxS, PFOA and PFNA are only indicative due to many reported non-detects (55 pg/g fw, 35 pg/g fw and 118 pg/g fw respectively).

## Lipid content

The mean and RSDs (in parentheses) for the lipid contents of the food samples were calculated to be 5.1 % (RSD=16 %) for the sample of Veal, 5.3 % (RSD=22 %) for the Halibut sample and 100 % (0.19 %) for the sample of Fish oil.

## Acknowledgements

The laboratories are acknowledged for their participation in this interlaboratory comparison and in their interest in its overall objectives, thereby making it clear that they value good analytical performance. All the individual analysts are acknowledged for their contributions to the results.

We thank Suzanne Faxnel at the Swedish Museum of Natural History for the Fish-sample, Dr. Ron Hoogenboom at the University of Research in Wageningen for providing us with the sample of veal and Vedde AS. for the kind gift of Fish oil and Cambridge Isotope Laboratories, Inc. for providing the standard solutions for this interlaboratory study.

Study announcement and  
instructions for participants

**March 2022**

## **Announcement for Interlaboratory Comparison on POPs in Food 2022**

---

### **Introduction**

We hereby announce the 23<sup>rd</sup> round of the Interlaboratory Comparison on the Determination of POPs in Food (“The Norwegian POPs in Food-study”). The study is open for academic, regulatory as well as commercial laboratories world-wide. The organizer of this study is Department of Food Safety at the Norwegian Institute of Public Health, Oslo, Norway. The study is scheduled to take place from April to August 2022.

A draft report will be available by October 2022, and the final report will be available to the participants by December 2022. All participants who have contributed to the results will receive a certificate of participation in the study.

### **Objectives**

One of the main objectives of this exercise is to assess the interlaboratory consistency in results from analyses of dioxins, PCBs, PBDEs, HBCDs and PFAS in regular food items known to contribute to the intake in the general population. Further, the world-wide readiness and capacity in analysing halogenated persistent organic pollutants in food will be demonstrated. The study also serves as a tool of quality assurance for the participating laboratories.

### **Participants**

We encourage all laboratories working in this field to participate and assess their analytical performance. To do this, participants are requested to completely fill out the Registration Form and mark the desired sample types and what analyte solutions they intend to determine.

### **Analytical requirements**

In this interlaboratory comparison, all the seventeen 2, 3, 7, 8-substituted PCDDs and PCDFs, the four non-ortho PCBs, CB-77, 81, 126 and 169 as well as the eight mono-ortho PCBs, CB-105, 114, 118, 123, 156, 157, 167, and 189 will be assessed.

In addition, the participants are invited to determine six marker PCBs, eight PBDEs and HBCDs. The concentration of the following congeners can be reported: CB-28, 52, 101, 138, 153 and 180 and BDE-28, 47, 99, 100, 153, 154, 183 and 209.

The concentration of  $\alpha$ -HBCD,  $\beta$ -HBCD and  $\gamma$ -HBCD as well as the total of these isomers will also be assessed.

For the matrix intended for the determination of PFASs, the participants are asked to report one or more of the following components: Perfluorooctanesulfonate (PFOS), perfluorohexanesulfonate (PFHxS), perfluorooctanoate (PFOA), perfluorononanoate (PFNA), perfluorodecanoate (PFDA) and perfluoroundecanoate (PFUnDA).

The test materials for the lipophilic POPs consist of three fresh food homogenates. You can choose to analyse one, two or all three of the food items. We encourage you to determine as many analytes as possible. You are further requested to determine and report the lipid content of the foods, except for the sample for PFAS.

In addition, one sample Fishfor the analysis of selected PFASs will be available.

We also include standard solutions of all analytes, except PFAS, that should be analysed as solutions of known concentration, which may be used to check your own calibration solutions.

### Test material

The test materials consist of three unfortified natural food product homogenates:

- Veal (labelled “Veal-2022”) ~100 g
- Halibut filet (labelled “Halibut-2022”) ~70 g
- Fish oil (labelled “Fish oil-2022”) ~50 g
- Fish (PFASs only) (labelled “Fish-2022”)

The samples will be distributed by an international courier service to the participating laboratories.

### **Please note:**

**In order to avoid delay or retention of the samples at customs, please inform us if there are import restrictions in your country for any of the samples.**

### Instructions for analysis and reporting

In short, the participating laboratories should:

- use their own standard operation procedures for extraction, clean-up and instrumental determination
- use their own reference standards for identification and quantification
- report one single concentration for each analyte in each food matrix determined on fresh weight basis
- report limits of detection for all measured analytes in each food item
- report the lipid content

Further detailed instructions and reporting forms will be sent by e-mail simultaneously with the dispatch of the samples in April.

### Time schedule

Announcement	<b>March 2022</b>
Return of registration form	<b>April 30<sup>th</sup>, 2022</b>
Shipment of test material	<b>From April 01<sup>th</sup>, 2022</b>
Confirmation of receipt of test material by participant	<b>Within 7 days after receivement</b>
<b>Reporting of test results</b>	<b>August 01<sup>st</sup>, 2022</b>
Publication of draft report on website	<b>October 2022</b>

Final report available to all participants

**December 2022**

### **Participation fee**

All laboratories that have received the test materials will receive a corresponding invoice in Norwegian kroner (NOK). The participation fee for any combination of the analytes in one food item is 10 500 NOK, in two food items 12 700 NOK, 14 900 NOK for three food items and for the complete set of all four food items 15 900 NOK.

As the inclusion of the PFASs-matrix still is new, all the receivers of this invitation are encouraged to spread the words to possibly interested laboratories!

## Interlaboratory Comparison on Dioxins in Food 2022

### Instructions for participants

April 2022

#### 1. Introduction

This is the 23<sup>rd</sup> Round of the Interlaboratory Comparison Study on the Determination of POPs in Food organised by the Section for Food Safety, Norwegian Institute of Public Health, Oslo, Norway.

The objective of this exercise is to assess the interlaboratory comparability of the results from analyses of all dioxins and dioxin-like PCBs included in the WHO-TEF schemes in regular foods. Participants may also determine and report concentrations of six marker PCBs, eight polybrominated diphenylethers (PBDEs) and hexabromocyclododecane (HBCD). The exercise serves as a quality assurance instrument for the participating laboratories. A further purpose is to assess the world-wide readiness and capacity for the determination of dioxin-like compounds, marker PCBs, PBDEs and HBCD in food. Instructions for the analysis and submission of results are given below.

Additionally, we also offer a sample of perch for the determination of PFAS.

**Please read these instructions carefully before starting the experimental work.**

The participating laboratories will contribute to the interlaboratory comparability in the analytical performance for determination of

- dioxins and furans: all seventeen 2,3,7,8-substituted PCDDs and PCDFs
- non-ortho PCBs: CB-77, 81, 126 and 169
- mono-ortho PCBs: CB-105, 114, 118, 123, 156, 157, 167 and 189
- indicator PCBs: CB-28, 52, 101, 138, 153 and 180
- PBDEs: BDE-28, 47, 99, 100, 153, 154, 183 and 209
- HBCD α-HBCD, β-HBCD, γ-HBCD and total HBCD

in the following samples:

- Veal (Veal-2022)
- Halibut filet (Halibut-2022)
- Fish oil (Fish oil-2022)

The mentioned analytes can also be determined in the respective six standard solutions. For HBCD, concentrations of α-HBCD, β-HBCD and γ-HBCD as well as the total of these isomers will be assessed.

The participants also are given the opportunity to determine

- perfluorooctanesulfonate (PFOS)
- perfluorohexanesulfonate (PFHxS)
- perfluorooctanoate (PFOA)
- perfluorononanoate (PFNA)
- perfluorodecanoate (PFDA)
- perfluoroundecanoate (PFUnDA).

in the following sample:

- Fish (Fish-2022)

## 2. Participants

A list of participants is attached. 46 laboratories have so far announced their participation in the study.

## 3. Design of the study

### 3.1 Test materials

#### Samples

One standard solution of each:

- EDF-5008-50 with PCDDs/PCDFs at concentrations 2:5:10 pg/μl for tetra:penta:hexa-hepta:octa chlorinated dibenzo-p-dioxins/-dibenzo furans respectively
- EC-4986/1000 with non-ortho PCBs at concentration 10 pg/μl
- EC-4987/100 with mono-ortho PCBs at concentration 100 pg/μl
- EC-5179/50 with marker PCBs at concentration 100 pg/μl
- EO-5103/100 with PBDEs at concentration 25 pg/μl, except BDE-209 at 100 pg/μl
- ULM-4834-S/100 with α-HBCD at a concentration 500 pg/μl

One sample of each

- approx. 100 g of veal
- approx. 70 g halibut
- approx. 50 g fish oil
- approx. 25 g fish (PFAS only)

We do not provide any standard solution for the determination of PFAS.

#### Fortification

The samples are prepared from regular market foods. There is no fortification or spiking of the target analytes in the food samples.

### Shipment

The samples are fresh frozen food homogenates. They are distributed by international courier and should reach the receiving laboratory in good condition within a few days.

### 3.2 Coding

#### Coding of laboratories

Upon arrival of the samples in the participant's laboratory, the Microsoft excel file named "Participant confirmation", shall be filled in and returned to the coordinators by e-mail. The code of the laboratory will then be given by the co-ordinators. The laboratory codes will not be revealed to the other participants or to any third parties.

#### Coding of samples

Veal	Veal-2022
Halibut	Halibut-2022
Fish oil	Fish oil-2022
Fish (PFAS only)	Fish-2022

*The above sample coding is marked on the sample bottles.*

### 3.3 Analytical procedure

#### Storage of the samples

The samples are fresh, frozen homogenates of natural food items. They are shipped frozen and should be stored frozen until they are analysed.

#### Methods to be used

Laboratories shall use

- their own methods for sample preparation and instrumental analysis
- their own internal- and quantification standards
- their own lipid determination procedure

#### Standard solutions

The standard solutions should be analysed using the laboratory's own quantification standards and methods and the results shall be reported.

#### General

Beware of the high risk of background contamination and positive blank values when analysing food samples with levels of dioxins, PCBs, PBDEs and HBCD in the low ppt range.

Use sample size according to expected levels of dioxins for the determinations in order to achieve a detection level that leaves as few as possible analytes as non-detected. The sample amount dispatched is not meant for replicate analyses.

The samples might become inhomogeneous during freezing and transport. Re-homogenise all received material of each food item before any portion is taken out for analysis.

An estimate of the lipid content in the samples follows below:

- Veal: 5-10 %
- Halibut: 5-10 %
- Fish oil: 95-99 %

#### **4. Reporting**

##### **4.1 Results to be reported**

Laboratories are recommended to report as many as possible of the congeners mentioned in chapter 1.

The reports **should** include the determined lipid percent for the samples, with the exception of the fish-sample designated for the analysis of PFAS.

The analytical report must include concentrations for all the congeners in all the samples on fresh weight basis, see Report forms B, C, D for PCDD/PCDF and dioxin-like PCBs and Report form 2, 3, 4 for marker PCBs, PBDEs and HBCD, and the reportform “PFAS-2022” for PFASs.

Laboratories must report one concentration on fresh weight basis for each congener which is detected ( $S/N \geq 3$ ), **as well as** the limit of determination (LOD,  $S/N = 3$ ) for each sample. Non-detected congeners ( $S/N < 3$ ) must be marked ND in the Comments column of the Report form. **Please note that the LOD will be used as concentration of non-detected congeners.**

For the reporting of PFAS: The results should be reported as the anion, not the salt!

##### **4.2 Checklist**

Please use the attached checklist before returning the Report forms with your results.

##### **4.3 Submitting results**

Four Microsoft Excel files are provided to each participant comprising:

##### **Participants confirmation**

- Confirmation of receiving test materials

##### **Report form dioxins and dioxinlike PCBs**

- analytical data, Report forms A, B, C and D

##### **Report form marker PCBs, PBDEs and HBCD**

- analytical data, Report forms 1, 2, 3 and 4

## Report form for PFASs

Participants are requested to submit their reports electronically to avoid possible transcription errors.

*Please, do not alter rows or columns in the original Report forms!*

The electronic report shall be sent to [dioxin@fhi.no](mailto:dioxin@fhi.no) within the deadline.

### Deadline

**The reports must be in our hands no later than August 01<sup>th</sup>, 2022** to enable us to prepare the draft report to be published by the end of October 2022. There will normally be no extension of this deadline. A confirmation for the receipt of your results will be sent to you by e-mail within a week.

### 5. Statistical evaluations

Prior to the final report, a draft version will be prepared based on the data reported by the end of October 2022. The co-ordinators will calculate mean, median and between-laboratory standard deviations for each congener. Outliers will be removed, and consensus values will be calculated. In case of extreme deviation from normal distribution, appropriate procedures will be used to get the best estimate of the true value as possible. For the dioxin-like compounds, TEQ values will be calculated for each laboratory and a consensus TEQ value based on the consensus of the congeners. Z-scores will be calculated for laboratories' results for all congeners, and for PCDD/PCDF TEQs and PCB TEQs as well.

### 6. Final report

The final report will be prepared by the co-ordinators and published in December 2022 and will then be made available for all interested parties in an electronic version on <http://www.fhi.no>. All participants will be presented by their laboratory code. Prior to this, a draft will be published on the Internet by the end of October. Certificates of participation in the study will be given to all laboratories submitting results.

### 7. Fee

To all laboratories that have received the materials, an invoice will be sent. The participation fee for any combination of the 29 dioxin-like congeners, six marker PCBs, 8 PBDEs, HBCD and PFAS is

## Norwegian Institute of Public Health

- NOK 10 500 for one food item
- NOK 12 700 for two food items
- NOK 14 900 for three food items.
- NOK 15 900 for four food items

Up to six standard solutions will be distributed free of charge to all participants, dependent on which analytes the participating laboratories intend to determine.

Invoices will be sent out after we have received the Participant confirmation from the participants.

## 8. Time schedule

Announcement	<b>February 2022</b>
Return of registration form	<b>March 30<sup>th</sup>, 2022</b>
Shipment of test material	<b>From April 01<sup>th</sup>, 2022</b>
Confirmation of receipt of test material by participant	<b>Within 7 days after receivement</b>
<b>Reporting of test results</b>	<b>July 01<sup>st</sup>, 2021</b>
Publication of draft report on web-site	<b>September 2022</b>
Final report available to all participants	<b>December 2022</b>

Please be sure that your results are reported in time as there normally will be no extension of the deadline.

## 9. Co-ordinators of the study

## Checklist

In order to avoid possible misunderstandings and errors when reporting your results, we here give a list of possible pitfalls. Please, check this list and your Report forms before reporting your results.

- Are the results for each congener filled out in the correct order? Be especially aware of 2,3,4,6,7,8- and 1,2,3,7,8,9-HxCDF, and PCB 81.
- Are all congener results reported in **pg/µl** for standards and **pg/g** for samples?
- Did you remember to report the lipid percent of the samples?
- Are the results of the samples reported on a *fresh weight basis*?
- Are both concentration and LOD reported for each congener?
- Are sample amount and measured lipid content filled in?
- Are not detected congeners marked with ND in the Comments column?

Norwegian Institute of Public Health

Homogeneity testing

## **Homogeneity testing of test materials for “Interlaboratory Comparison on Dioxins in Food” organised by the Norwegian Institute of Public Health**

### **Introduction**

The International Harmonized Protocol for the Proficiency Testing of Analytical Chemistry Laboratories (Pure Appl Chem 2006;78:145-96) states that “The bulk material prepared for the proficiency test must be sufficient homogeneous and stable, in respect of each analyte, to ensure that all laboratories receive distribution units that do not differ to any consequential degree in mean analyte concentration. The scheme provider must clearly state the procedure used to establish the homogeneity of the test material”.

The protocol requires that the variation in composition among the distributed units is negligible in relation to variation introduced by the measurements conducted by the participants of the proficiency test (PT). The estimated variation between the samples ( $s_{sam}$ ) should be less than 30 % of the target standard deviation ( $\sigma_p$ ), i.e.,  $s_{sam} < 0.3 \sigma_p$ .

Further the protocol states that homogeneity testing is required to reassure the participants in proficiency testing schemes that the distributed units of the test material are sufficiently similar. The test specified calls for the selection of ten or more units at random after the putative homogenized material has been split and packaged into discrete samples for distribution. The material from each sample is then analyzed in duplicate, under randomized repeatability conditions (that is, all in one run) using a method with sufficient analytical precision. The value of  $\sigma_{sam}$  is then estimated from the mean squares after one-way analysis of variance (ANOVA).

The quality of the analytical method used for homogeneity testing has a large impact on the results. If the analytical precision ( $\sigma_{an}$ ) of the homogeneity test is not small, important sampling variation may be obscured by analytical variation. We may get a non-significant result when testing for heterogeneity, not because it is not present, but the test has no power to detect it. It is recommended that the analytical (repeatability) precision of the method used in the

homogeneity test should satisfy  $\sigma_{an} < 0.5 \sigma_p$

### **Consequences for the Interlaboratory Comparison on Dioxins in Food**

Below follows the consequences for the Interlaboratory Comparison on Dioxin in Food;

#### **1.**

The protocol recommends duplicate analysis of at least 10 distribution units. Due to limited amount of test material in each distribution unit and the requirement for sufficiently low analytical standard deviation, the test analysis has to be restricted to PCB, e.g., 6 indicator PCB or CB-153. It is, however, questionable whether analysis of indicator PCB also reflects the distribution of dioxins and other contaminants in the sample, as the test material is often prepared by mixing specifically contaminated material with background contaminated material in order to achieve a sufficient contamination level. Therefore, the distribution of PCBs in the sample might not be relevant for the distribution of dioxins in the sample.

The analytical precision of the method used in the homogeneity test should be less than half of the target standard deviation, i.e.,  $\sigma_{an} < 0.5 \sigma_p$ . For determination of dioxins, the target standard deviation may be approximated by the requirement for trueness (Commission Regulation (EC) No 1883/2006) of  $\pm 20\%$  for total TEQ, i.e., the analytical precision should be less than 10 %. This is unrealistic to achieve for the determination of dioxins.

**2.**

The homogeneity testing using, e.g., the determination of indicator PCBs, requires the analysis of at least 60 samples prior to shipment of the distribution units to the participants. This causes problems for the time schedule of the sample preparation and involves high costs.

**3.**

The laboratory conducting the homogeneity test on PT analytes would have access to the test material and knowledge of contamination levels prior to the start of the PT and would therefore not be qualified for participation in the PT.

### **Conclusion**

A valid testing of homogeneity of the test materials of the Interlaboratory Comparison (ILC) on Dioxins in Food with respect to the distribution of dioxins and dioxin-like PCBs is not guaranteed using indicator PCBs. It is doubtful that the analytical precision is small enough to detect a lack in sufficient homogeneity. Given the need for annually testing three different matrices for homogeneity, alternative, rapid and low cost homogeneity tests using surrogate should be applied.

### **Present approach for homogeneity testing for the ILC on Dioxins in Food**

The Harmonized Protocol states under Chapter Testing for sufficient homogeneity: “Tests for sufficient homogeneity are in practice never wholly satisfactory... However, given that sufficient homogeneity is a reasonable prior assumption (because proficiency testing scheme providers do their best to ensure it), and that the cost [and time-consumption] of testing for it is often high, it is sensible to make the main emphasis the avoidance of “Type 1 errors” (that is, false rejection of a satisfactory material).

Having this in mind and the facts that it is impossible to determine all analytes for homogeneity testing of food test material and that a single indicator analyte not necessarily reflects the distribution of the other analytes, we have developed an approach that ensures that the test material is thoroughly blended and evenly distributed among the individual test bottles. The homogeneity testing of solid samples is based on the principle of measuring electrolytic conductivity after addition of sodium chloride to a small portion of the coarsely blended test material. A demonstration of homogeneous distribution of the added salt in the sub samples would indicate our ability to evenly blend the food matrix, i.e., with this approach we ensure the efficiency of our blending procedure. This is especially of importance when blending highly contaminated food matrices with background contaminated food matrices.

When testing homogeneity of the food samples, sodium chloride was added to about 10% of the test material in such an amount that the conductivity was about doubled compared to the natural conductivity. This sub-sample was added to the total sample. For example, to 1 kg of homogenised chicken meat, 150 g NaCl were added resulting in an addition of 1 % NaCl to the final test material of 15 kg. Conductivity measurements are performed as follows: boiling water is added to 10.0 g of the test material, and the resulting dispersion is ultrasonicated. After centrifugation, the extract is filtered through folded paper filters and allowed to cool to room temperature. The electrolytic conductivity of the water extract is measured using a conductivity meter.

Homogeneity of the test material was demonstrated by comparing the conductivity in water extracts of 10 samples from the same bottle (variation within bottles), and in extracts from 10 different bottles (variation between bottles).

### **Example**

As an example, the relative standard deviation (RSD) of 10 conductivity measurements within a sample bottle containing chicken meat homogenate was 2 %. The RSD for the measurement of samples from 10 different, randomly selected bottles was 3 %. The contribution of the inhomogeneity to the total variation, calculated from  $RSD_{inhomogeneity}^2 = RSD_{between}^2 - RSD_{within}^2$ <sup>1</sup> was 2.2 % and hence small and acceptable. The total uncertainty for the determination of PCDD/Fs is usually considerably larger, so the measured contribution of inhomogeneity to the total uncertainty can be neglected

## Appendix 1:

Presentation of results  
for analyte solution

## Appendix 1: Presentation of results: Analyte solution

### Statistic calculations for PCDDs, PCDFs, dioxin-like PCBs, indicator PCBs, PBDEs and $\alpha$ -HBCD

The analyte solution contained

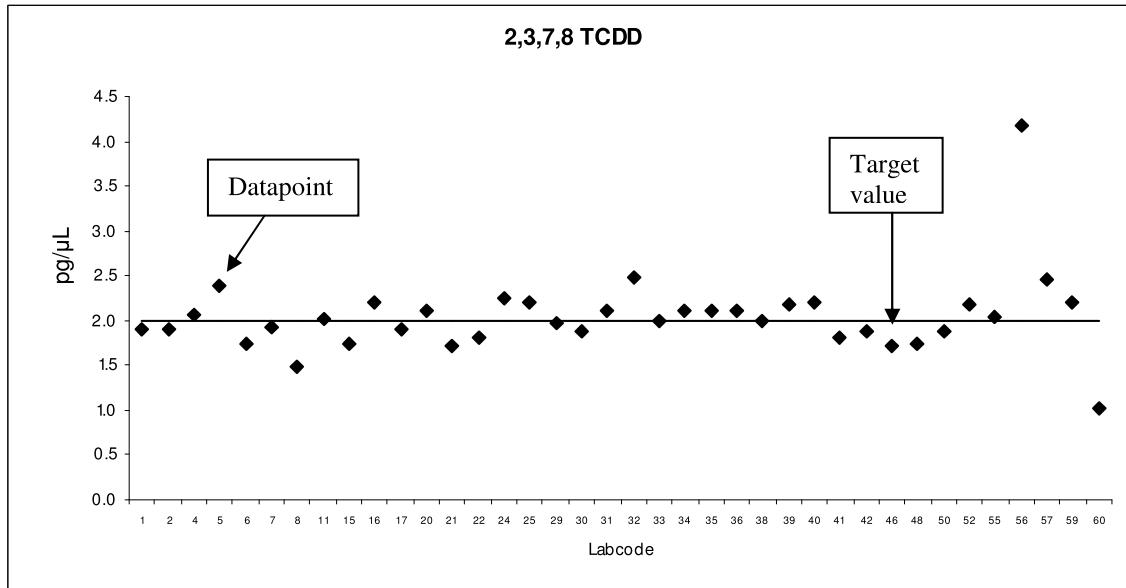

- PCDDs/PCDFs at concentrations of 2:5:10 pg/ $\mu$ l for tetra:penta-hexa-hepta:octa chlorinated dibenzodioxins/furans respectively.
- Non-ortho PCBs at concentration of 10 pg/ $\mu$ l.
- Mono-ortho PCBs and indicator PCBs at concentration of 100 pg/ $\mu$ l.
- PBDE at a concentration of 25 pg/ $\mu$ l, except BDE-209 at 100 pg/ $\mu$ l.
- $\alpha$ -HBCD at a concentration of 500 pg/ $\mu$ l.

These concentrations are called the congeners' target value.

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

1. The median was calculated from all the reported data.
2. Values outside a range of 50 % to 150 % of this median, were defined as outliers and removed from the data set.
3. Median, mean and standard deviation were re-calculated from the remaining data. This median and mean were called consensus median and mean.

The diagram shows the target value and the reported data. Values outside a range of 50 % to 150 % of "median of all values", were defined as outliers and are not shown in the plot.

### Z-Scores of individual congeners

Z-scores of each congener were calculated for each laboratory according to the following equation:

$$z = (x - \bar{X})/\sigma$$

Where  $x$  = reported value;  $\bar{X}$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

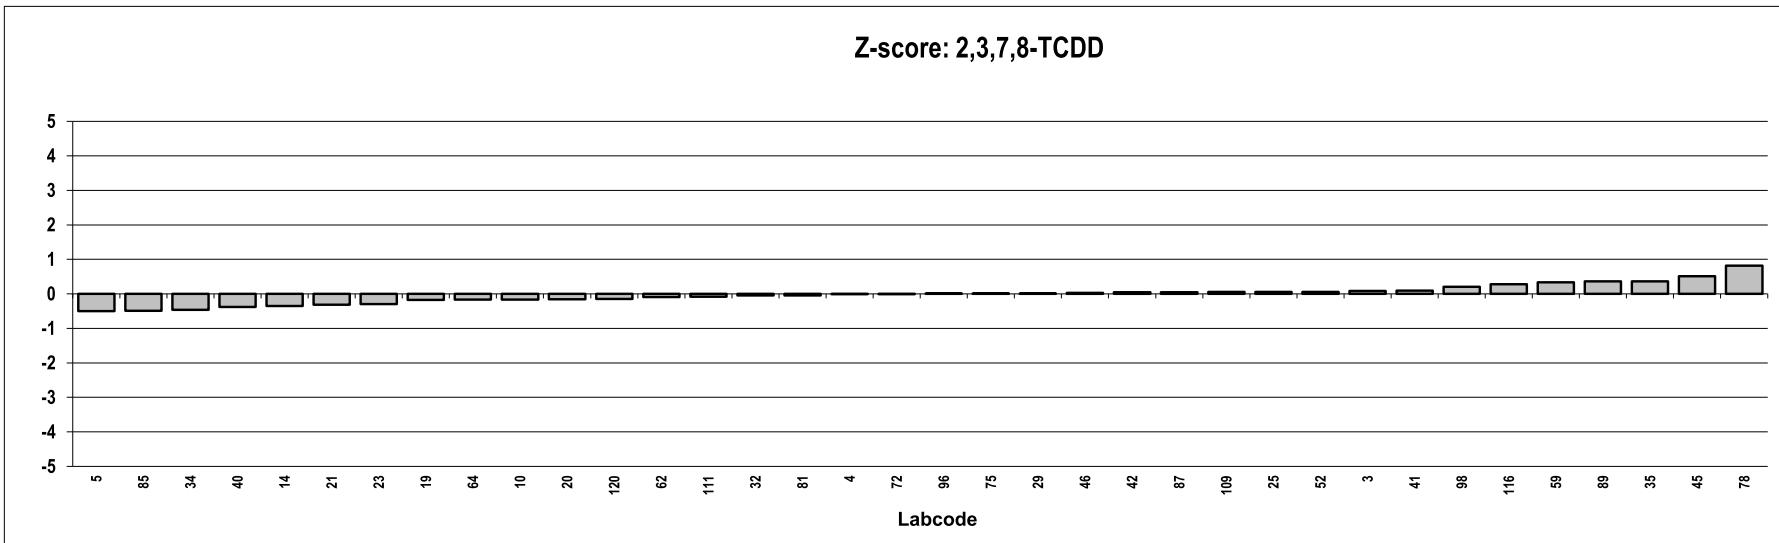

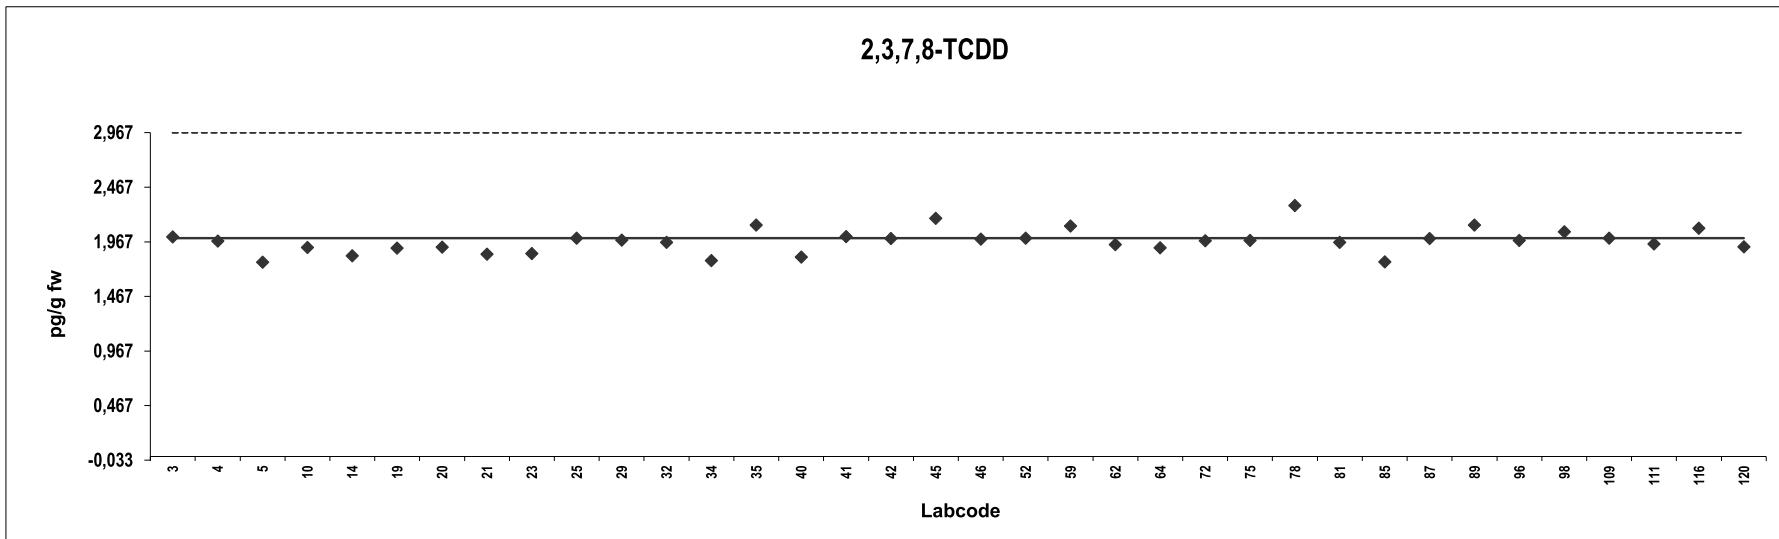

**Analyte solution**  
Congener: 2,3,7,8-TCDD

Presentation of results for  
Veal-2021

## Appendix 2: Presentation of results: Veal-2022

### Statistic calculations for PCDDs, PCDFs and dioxin-like PCBs

For each congener, the outliers were removed, and the consensus calculated according to the following procedure:

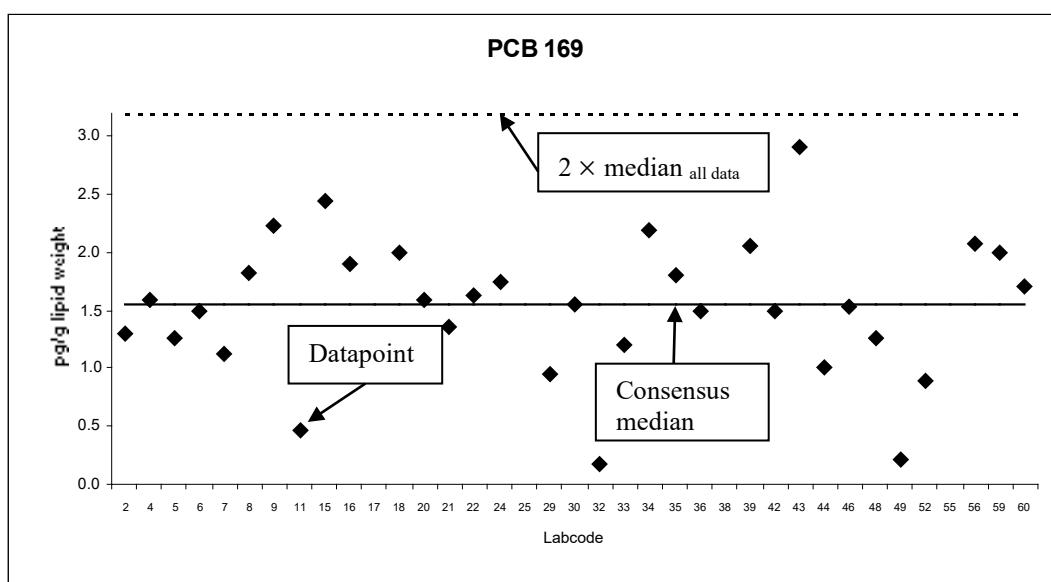

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners.
2. Values exceeding  $2 \times$  this median were defined as outliers and removed from the data set.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.

### Statistic calculations for indicator PCBs, PBDEs and HBCD

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners (NDs).
2. Values exceeding  $2 \times$  this median were defined as outliers and removed from the data set. The NDs were also removed.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.
4. For comparison, median, mean and standard deviation were also calculated without removing NDs.

The diagram shows the reported data up to approximately the limit for outliers ( $2 \times$  the first median).

### Z-Scores of individual congeners

Z-scores of each congener were calculated for each laboratory according to the following equation:

$$z = (x - X)/\sigma$$

where  $x$  = reported value;  $X$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

Presentation of results for  
Halibut 2022

## Appendix 3: Presentation of results: Halibut-2022

### Statistic calculations for PCDDs, PCDFs and dioxin-like PCBs

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

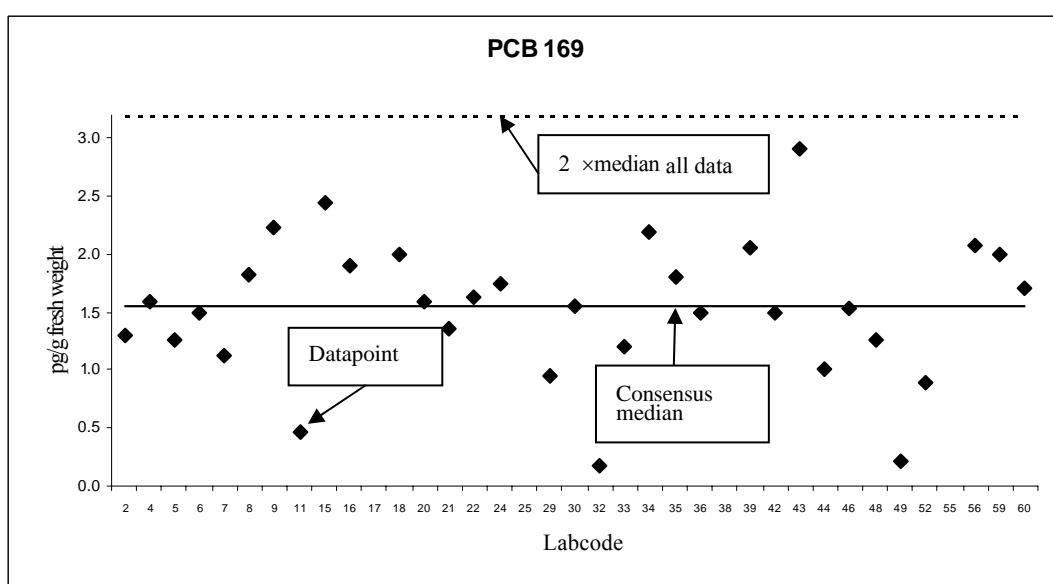

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners.
2. Values exceeding  $2 \times$  this median were defined as outliers and removed from the data set.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.

### Statistic calculations for indicator PCBs, PBDEs and HBCD

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners (NDs).
2. Values exceeding  $2 \times$  this median were defined as outliers and removed from the data set. The NDs were also removed.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.
4. For comparison, median, mean and standard deviation were also calculated without removing NDs.

The diagram shows the reported data up to approximately the limit for outliers ( $2 \times$  the first median).

### Z-Scores of individual congeners

Z-scores of each congener were calculated for each laboratory according to the following equation:

$$z = (x - X)/\sigma$$

where  $x$  = reported value;  $X$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

## **Appendix 4:**

---

Presentation of results for  
Fish oil-2022

## Appendix 4: Presentation of results: Fish oil-2022

### Statistic calculations for PCDDs, PCDFs and dioxin-like PCBs

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

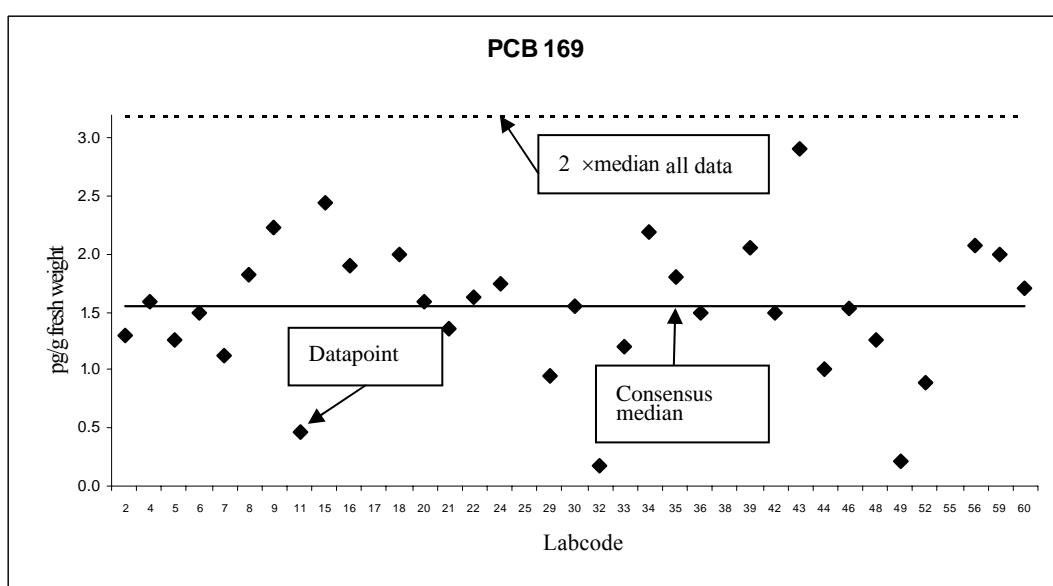

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners.
2. Values exceeding  $2 \times$  this median were defined as outliers and removed from the data set.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.

### Statistic calculations for indicator PCBs, PBDEs and HBCD

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners (NDs).
2. Values exceeding  $2 \times$  this median were defined as outliers and removed from the data set. The NDs were also removed.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.
4. For comparison, median, mean and standard deviation were also calculated without removing NDs.

The diagram shows the reported data up to approximately the limit for outliers ( $2 \times$  the first median).

### Z-Scores of individual congeners

Z-scores of each congener were calculated for each laboratory according to the following equation:

$$z = (x - X)/\sigma$$

where  $x$  = reported value;  $X$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

## Appendix 5: Presentation of results: Fish-2022

### Statistic calculations for PFASs

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners (NDs).
2. Values exceeding  $2 \times$  this median were defined as outliers and removed from the data set. The NDs were also removed.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.
4. For comparison, median, mean and standard deviation were also calculated without removing NDs.

The diagram shows the reported data up to approximately the limit for outliers ( $2 \times$  the first median).

### Z-Scores of individual congeners

Z-scores of each congener were calculated for each laboratory according to the following equation:

$$z = (x - X)/\sigma$$

where  $x$  = reported value;  $X$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

## **Appendix 6:**

Presentation of results  
for lipid determination

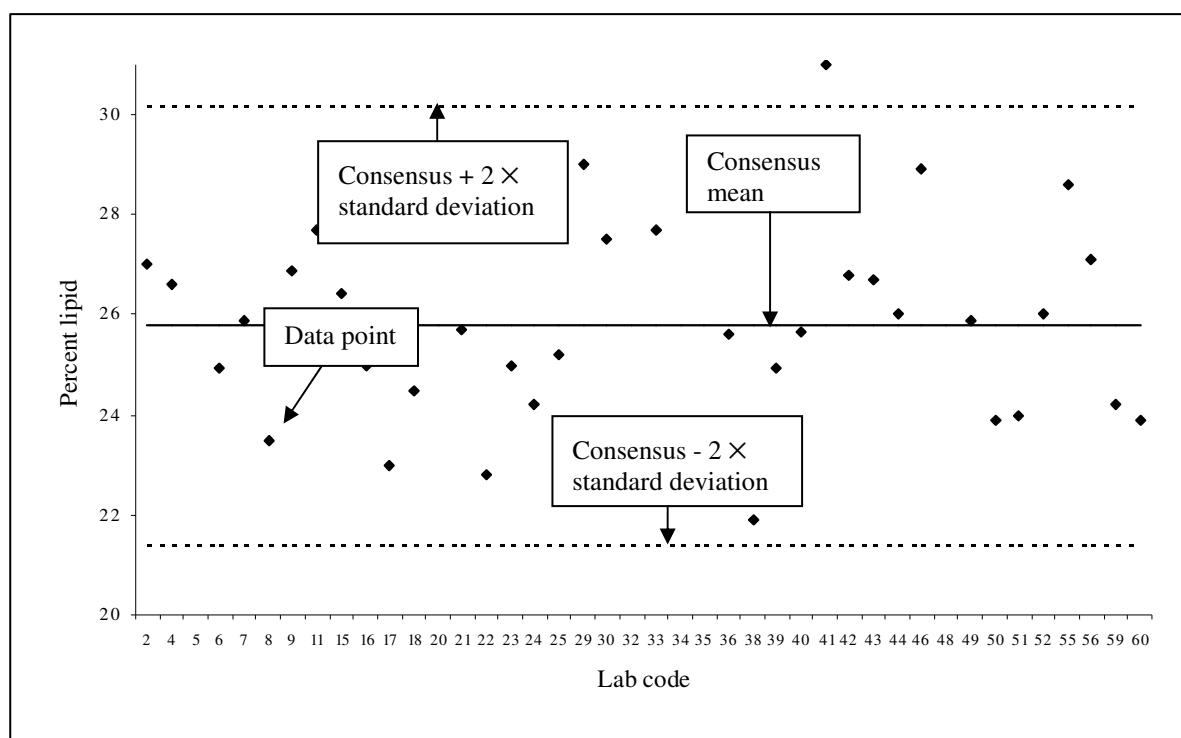

## Presentation of results for lipid determination

Removal of outliers and calculation of consensus were done by the following procedure:

1. The mean was calculated from all the reported data.
2. Values outside a range of  $\pm 2 \times$  the standard deviation of this mean were defined as outliers and removed from the data set.
3. Mean, standard deviation and median were re-calculated from the remaining data. This mean was called consensus.

The diagram shows the reported data with consensus and consensus  $\pm$  the new standard deviation  $\times 2$ .

### Z-Scores of lipid content

Z-scores of lipid content were calculated for each laboratory according to the following equation:

$$z = (x - X)/\sigma$$

where  $x$  = reported value;  $X$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.
