Tittel	Botilbud til mennesker med demens
English title	The physical environment for people with dementia
Institusjon	Nasjonalt kunnskapssenter for helsetjenesten
Ansvarlig	Magne Nylenå, direktør
Forfattere	Dalsbø, Therese Kristine, <i>seniorrådgiver</i> Kirkehei, Ingvild, <i>forskningsbibliotekar</i> Dahm, Kristin Thuve, <i>forsker</i>
ISBN	978-82-8121-930-4
Notat	Desember – 2014
Prosjektnummer	796
Publikasjonstype	Notat – systematisk litteratursøk med sortering
Antall sider	14 (26 inklusiv vedlegg)
Oppdragsgiver	Helsedirektoratet
Emneord(MeSH)	Dementia, systematic review
Sitering	Dalsbø TK, Kirkehei I, Dahm KT. Effekten av botilbud til mennesker med demens. Notat 2014. Oslo: Nasjonalt kunnskapssenter for helsetjenesten, 2014.

Nasjonalt kunnskapssenter for helsetjenesten fremskaffer og
formidler kunnskap om effekt av metoder, virkemidler og tiltak og
om kvalitet innen alle deler av helsetjenesten. Målet er å bidra til
gode beslutninger slik at brukerne får best mulig helsetjenester.
Kunnskapssenteret er formelt et forvaltningsorgan under Helse-
direktoratet, men har ingen myndighetsfunksjoner og kan ikke
instrueres i faglige spørsmål.

Nasjonalt kunnskapssenter for helsetjenesten

Oslo, desember 2014

Hovedfunn

Nasjonalt kunnskapssenter for helsetjenesten oppsummerte i 2009 til gjengelig forskning vedrørende effekt av Botilbud til mennesker med demens (1).

Kunnskapssenteret ble bedt av Helsedirektoratet om å oppdatere rapporten fra 2009 ved å søke etter nyere relevante publikasjoner.

Vi oppdaterte det systematiske litteratursøket fra vår forrige rapport, og søker ble avgrenset til systematiske oversikter. Søket ble utført i november 2014 og det ble søkt i flere medisinske databaser. To personer gikk uavhengig av hverandere gjennom identifiserte referanser og vurderte relevans i forhold til inklusjonskriteriene. Vi identifiserte totalt 476 nye referanser i litteratursøket. Av disse fant vi seks mulige relevante oversiktartikler. Fem av de seks var publisert i 2014, den siste var fra 2013. Tematisk fordelte de seg slik:

- To oversikter om effekt av tiltak for bedre utendørsmiljø og bruk av hage (2, 3),
- En oversikt om effekt av teknologisk støtte (4) og
- Tre oversikter om effekt av tiltak for å forebygge fall og tiltak for et støttende bomiljø (5-7).

Oversiktene vi fant ble ikke lest i fulltekst. Dokumentasjonen i oversiktene er ikke oppsummert eller kvalitetsvurdert av Kunnskapssenteret.

Tittel:

Botilbud til mennesker med demens – systematisk litteratursøk med sortert referanseliste

Publikasjonstype:

Systematisk litteratursøk med sortering

Systematisk litteratursøk med sortering er resultatet av å
- søke etter relevant litteratur ifølge en søkestrategi og
utarbeide en sortert referanseliste

Svarer ikke på alt:

- Ingen helseøkonomiske vurderinger
- Ingen anbefalinger

Hvem står bak denne publikasjonen?

Kunnskapssenteret har gjennomført oppdraget etter forespørsel fra Helsedirektoratet

Når ble litteratursøket utført?

Søk etter studier ble avsluttet i november 2014.

Key messages

The Ministry of Health commissioned the National Knowledge Center for The Health Care Services to review the available evidence on the physical environment for people with dementia. This work was published in 2009, report number 11 (1).

The Norwegian Directorate of Health asked us to update the report. We have performed a literature search to find potential new and relevant systematic reviews. We updated the previous systematic literature search and searched several relevant medical databases. The search was performed in November 2014. Thereafter, two persons independently read through all the titles and abstracts to find potential new reviews that met the pre-defined inclusion criteria. We read 476 references from the literature search and included six potentially relevant reviews. Five out of six articles were published in 2014, one was from 2013. Themes were:

- Outdoor and gardening (2, 3)
- Assistive technology (4)
- Fallprevention and supportive environment (5-7).

The reviews was not read in full text nor was the documentation critically appraised.

Title:

The physical environment for people with dementia – systematic literature search

Type of publication:

Systematic
reference list

A systematic reference list is the result of a search for relevant literature according to a specific search strategy.

Doesn't answer everything:

- No economic evaluations
- No recommendations

Publisher:

Norwegian Knowledge Centre
for the Health Services

Forord

Helsedirektoratet ba Nasjonalt kunnskapssenter for helsetjenesten om å oppdatere en rapport fra 2009 (1). Vi begrenset oss til å søke etter nyere systematiske oversikter. Oppdateringen inngår i arbeidet med den nye nasjonale veilederen om behandling av personer med demens.

Prosjektgruppen har bestått av:

- Therese Kristine Dalsbø, seniorrådgiver,
- Ingvild Kirkehei, forskningsbibliotekar og
- Kristin Thuve Dahm, forsker

Gro Jamtvedt

Avdelingsdirektør

Liv Merete Reinar

Seksjonsleder

Therese Kristine Dalsbø

Prosjektleder

Innledning

Nasjonalt kunnskapssenter for helsetjenesten oppsummerte i 2011 tilgjengelig forskning vedrørende effekt av tiltak for pårørende til hjemmeboende personer med demens (1). Hovedfunnene var presentert på side fire i rapporten slik:

«Studiene viste at forhold i fysiske omgivelser har vist bedring for personer med demens på fire hovedområder: nivå på dagligfunksjoner, adferdsforstyrrelser, positiv adferd og livskvalitet. Dokumentasjon taler for at små, tilrettelagte enheter med hjemlig miljø og lavere beboertethet har gunstig effekt på personer med demens.

Enkel utforming fremmet rom- og stedssans. Korte korridorer med få veivalg, grupper av rom med tilknyttede fellesarealer. Det ble ikke funnet effekt av skilting og fargekoder, fallforebygging eller subjektive barrierer, avhengig av grad av kognitiv svikt. Nøytral design og farger ga færre katastrofreaksjoner og lavere medikamentbruk. Overordnet bygningskonfigurasjon kan svekke orienteringevne. Særpreg på hvert rom, kortere korridorer, rolige omgivelser og få eslutningspunkter lettet orienteringevne. Romsans og fremkommelighet er bedre i mindre enheter med tilknyttede fellesrom.

Visuell modifisering og tilrettelegging kan omdirigere vandrere til trygge områder. Det foreligger noe evidens for å kamuflere utgangsdør eller håndtak mot utgang.

Høyere omgivelseslys hadde en beskjeden effekt på økning av sovnlengde, reduserte adferdsavvik og fremmet orienteringsevne. Enerom med muligheten for personlig og hjemlig preg, eiendeler og innredning ga mindre psykiske symptomer. Toalett som var lett tilgjengelig (synlig, åpen dør, nær soverom eller oppholdsrom) førte til økt bruk blant beboere med demens. Det er ikke vist at fysiske omgivelser påvirker prosesjon av demens. Formålsmessig bygd fysisk miljø har positiv effekt på livskvalitet».

Kunnskapssenteret ble bedt av Helsedirektoratet om å oppdatere rapporten fra 2009 ved å søke etter nyere relevante publikasjoner. Vi har valgt å gjøre oppdateringen ved å søke etter nyere systematiske oversikter. Vi har ikke kvalitetsvurdert

oversiktene og resultatene er ikke sammenstilt og diskutert. Oppdateringen inngår i arbeidet med den nye nasjonale veilederen om behandling av personer med demens.

I rapporten fra Kunnskapssenteret fra 2009 (søk utført i januar 2009) ble det søkt etter både systematiske oversikter og nyere enkeltstudier. Vi har gjort ett oppdatert søker etter systematiske oversikter publisert fra og med 2009.

Problemstilling

Hensikten var å oppdatere søkeret i rapporten fra 2009 som tok sikte på å oppsummere forskningsbasert kunnskap om botilbud for personer med demens.

Hovedspørsmål var:

- Hvordan bør botilbudet konkret utformes for personer med demens når disse ikke lenger er i stand til å ta vare på seg selv?

Delspørsmål var:

- Hvilke generelle trekk i arkitektur og design har best effekt for personer med demens?
- Hvordan bør bomiljø utformes for å tilrettelegge for personer med demens?
- Hvilken effekt har enkeltelementer i inne- og utemiljø på personer med demens?
- Hvordan bør boligrommene utformes for personer med demens når disse ikke lenger er i stand til å ta vare på seg selv?

Metode

Litteratursøking

Vi søkte systematisk etter litteratur i følgende databaser:

- Embase
- MEDLINE
- PsycINFO
- Cochrane Database of Systematic Reviews
- Database of Abstracts of Reviews of Effects (DARE)
- Health Technology Assessment Database (HTA)
- ISI Web of Science
- Cinahl
- PubMed

Forskningsbibliotekar Ingvild Kirkehei planla og utførte samtlige søk. Søket ble utført i november 2014. Vi brukte søkestrategiene fra søket som ble utført i 2009, og gjorde noen endringer i søkeord. Søket bestod av emneord og tekstord for demens eller kognitiv svikt kombinert med ulike søkeord for «utforming av bolig». Søket ble videre avgrenset til systematiske oversikter publisert fra og med år 2009. Alle søkerestrategiene finnes i vedlegg 1.

Nedenfor har vi listet opp inklusjons- og eksklusjonskriteriene slik de var presentert i rapporten fra 2009.

Inklusjonskriterier

Vi inkluderte systematiske oversikter (SR) med følgende inklusjonskriterier:

Populasjon: Personer med demens, kognitiv svikt

Intervensjon: Tilpasset utforming av bolig, interiør og bomiljø - inne og ute

Sammenlikning: Ikke tilrettelagt bomiljø eller egen bolig

Utfallsmål: Autonomitet, trygghet/skadeforebygging, brukertilfredshet hos patient og pårørende, livskvalitet

Språk: Ingen språkbegrensning

Eksklusjonskriterier

Studiedesign: Enkeltstudier.

Populasjon: Eldre uten angitt kognitiv svikt, mentalt retarderte uten demensutvikling

Tiltak: Medikamenter, ikke-fysisk miljø, behandlingstilbud som miljø/adferds-terapi, hjelpemidler, elektronikk og alarmer, smarthus, Snoezelen-rom, m.m.

Artikkelseleksjon

To av forfatterne (Dalsbø og Dahm) gikk gjennom alle titler og sammendrag for å vurdere relevans i henhold til inklusjonskriteriene.

Oversiktene vi fant ble ikke lest i fulltekst. Dokumentasjonen i oversiktene er ikke oppsummert eller kvalitetsvurdert av Kunnskapssenteret.

Resultat

Resultat av søk

Søket resulterte i 594 referanser. Etter å ha sjekket for dubletter var det 476 referanser. Disse 476 referansene ble gjennomgått av to personer, uavhengig av hverandre og sammenlignet i etterkant.

Vi vurderte seks av de identifiserte referansene som mulig relevante i henhold til inklusjonskriteriene. Disse referansene ble ikke lest i fulltekst.

Fem av de seks var publisert i 2014, den siste var fra 2013. Tematisk fordelte de seg slik:

- To oversikter om effekter av tiltak for bedre utendørsmiljø og bruk av hage (2, 3),
- En oversikt om effekt av bruk av teknologisk støtte (4) og
- Tre oversikter om effekt av tiltak for å forebygge fall og tiltak for et støttende bomiljø (5-7).

Mulige relevante oversiktsartikler, titler og sammendrag

De seks mulige relevante oversiktene er listet opp nedenfor (2-7).

1. Anderiesen H, Scherder EJ, Goossens RH, Sonneveld MH. A systematic review--physical activity in dementia: the influence of the nursing home environment. *Applied Ergonomics* 2014;45(6):1678-1686.

Abstract: Most older persons with dementia living in nursing homes spend their days without engaging in much physical activity. This study therefore looked at the influence that the environment has on their level of physical activity, by reviewing empirical studies that measured the effects of environmental stimuli on the physical activity of nursing home residents suffering from dementia. The electronic databases PubMed, PsycINFO, EMBASE, CINAHL and the Cochrane Library were used for the search. The search covered studies published between January 1993 and December 2012, and revealed 3187 abstracts. 326 studies were selected as potentially relevant; of these, 24 met all the inclusion criteria. Positive results on the residents' levels of

physical activity were found for music, a homelike environment and functional modifications. Predominantly positive results were also found for the small-scale group living concepts. Mixed results were found for bright or timed light, the multisensory environment and differences in the building footprint. Copyright 2014 Elsevier Ltd and The Ergonomics Society. All rights reserved.

2. Che Me R, Biamonti A. Spatial disorientation in Alzheimer's disease (AD): Systematic review on supportive environment in assisting the constant activities of daily living (ADLs). European Geriatric Medicine 2014;5:S92.

Abstract: Introduction: Individuals with Alzheimer's disease (AD) alongside with cognitive and behavioral changes, spatial disorientation and declining wayfinding abilities are the other major reasons for them to be institutionalized. These problems were associated with the reducing of mobility, navigation and autonomy in the environment they live in. As a result, they require high level of care with over-the-clock supervision to reach certain places and to perform activities of daily living (ADLs). This paper presents a general review on how improvement of environmental design may support spatial anticipation in performing constant ADLs. Method: A review on available literature using major electronic databases was performed on the difficulties of AD patients in performing ADLs mainly caused by the spatial disorientation. Nonpharmacological interventions by means of supportive environment and possible technological solutions are the main aspects of the review. Results: The largest number of studies focused on purposive design, environment and applicable technologies which are relevant in assisting individuals with AD in performing ADLs. Spatial disorientation resulted in getting lost in both familiar and unfamiliar environments. Environmental factors play a major role in designing the appropriate environment in assisting their orientation within their environment or space. Conclusion: Providing the supportive environment may sustain the ability of AD patients to remain active and perform ADLs independently as long as possible. As spatial disorientation leads to various orientation and mobility issues, the adoption of virtual environment system could possibly enhance the assessment in measuring the efficacy of the purposive designed environment.

3. Fleming R, Sum S. Empirical studies on the effectiveness of assistive technology in the care of people with dementia: a systematic review. Journal of Assistive Technologies 2014;8(1):14-34.

Abstract: Purpose: – The purpose of this paper is to assess the empirical support for the use of assistive technology in the care of people with dementia as an intervention to improve independence, safety, communication, wellbeing and carer support. Design/methodology/approach: – A total of 232 papers were identified as potentially relevant. Inclusion criteria were: studies published between 1995 and 2011, incorporated a control group, pre-test-post-test, cross sectional or survey design, type of interventions and types of participants. The 41 papers that met criteria were sub-

jected to an assessment of their validity using the model provided by Forbes. Following the assessment seven papers were considered as strong, ten moderate and 24 weak. The review is presented around the following topics: independence, prompts and reminders; safety and security; leisure and lifestyle, communication and tele-health; and therapeutic interventions. Findings: – The literature exploring the use of assistive technologies for increasing independence and compensating for memory problems illustrate the problems of moving from the laboratory to real life. The studies are usually limited by very small samples, high drop-out rates, very basic statistical analyses and lack of adjustment for multiple comparisons and poor performance of the technology itself. Originality/value: – Research to date has been unable to establish a positive difference to the lives of people with dementia by the general use of the assistive technology reviewed here.

4. Gonzalez MT, Kirkevold M. Benefits of sensory garden and horticultural activities in dementia care: a modified scoping review. *Journal of Clinical Nursing* 2014;23(19-20):2698-2715.

Abstract: AIMS AND OBJECTIVES: To provide a review on the benefits associated with the use of sensory gardens and horticultural activities in dementia care.

BACKGROUND: Maintaining quality of life is important in dementia care. Sensory gardens and horticultural activities are increasingly used in dementia care, yet their benefits are uncertain.

DESIGN: A modified scoping review with descriptive analysis of selected empirical studies.

METHODS: Systematic searches in Amed, CINAHL, MEDLINE, ISI Web of Science, Embase and Scopus were used. Search terms were the free-text concepts 'healing garden', 'horticultural therapy', 'restorative garden' and 'wander garden' which were combined with dementia and Alzheimer.

RESULTS: Sixteen studies were included with included participants ranging from eight to 129 participants. Research designs were case studies ($n = 2$), survey ($n = 1$), intervention studies with pretest/post-test design ($n = 11$) and randomised controlled studies ($n = 2$). Of these 16 studies, eight examined the benefits of sensory gardens, seven examined horticultural therapy or therapeutic horticulture and one examined the use of plants indoors. This study offers a review of the research addressing benefits of sensory gardens, therapeutic horticulture, horticultural therapy and other purposeful use of plants in dementia care. The reported findings are mainly on issues related to behaviour, affect and well-being. The findings are in general mutually supportive, however, with some contradictory findings. In addition, sleep pattern, well-being and functional level seem to improve.

CONCLUSIONS: These types of nonpharmacological interventions may improve well-being and affect and reduce the occurrence of disruptive behaviour. Additionally, the use of psychotropic drugs, incidents of serious falls, sleep and sleep pattern also seem to improve.

RELEVANCE TO CLINICAL PRACTICE: To further improve the use of the existing or planned gardens, an educational programme for staff that also includes skill training is recommended. 2013 John Wiley & Sons Ltd.

5. Whear R, Coon JT, Bethel A, Abbott R, Stein K, Garside R. What is the impact of using outdoor spaces such as gardens on the physical and mental well-being of those with dementia? A systematic review of quantitative and qualitative evidence. *Journal of the American Medical Directors Association* 2014;15(10):697-705.

Abstract: **OBJECTIVE:** To examine the impact of gardens and outdoor spaces on the mental and physical well-being of people with dementia who are resident in care homes and understand the views of people with dementia, their carers, and care home staff on the value of gardens and outdoor spaces.

DESIGN: Systematic review.

METHODS: Fourteen databases were searched from inception to February 2013. Forward and backward citation chasing of included articles was conducted; 38 relevant organizations were contacted to identify unpublished reports. Titles, abstracts, and full texts were screened independently by 2 reviewers in a 2-stage process and were discussed with a third reviewer where necessary. Results were synthesized narratively.

RESULTS: Seventeen studies were included: 9 quantitative, 7 qualitative, and 1 mixed methods. The quantitative studies were of poor quality but suggested decreased levels of agitation were associated with garden use. The views and experiences of the garden are discussed in relation to themes of how the garden was used, nature of interactions, impact/effect of the gardens, mechanisms/how the garden was thought to have an effect, and negatives (such as perception of the garden as a hazard and the limited staff time).

CONCLUSION: There are promising impacts on levels of agitation in care home residents with dementia who spend time in a garden. Future research would benefit from a focus on key outcomes measured in comparable ways with a separate focus on what lies behind limited accessibility to gardens within the residential care setting. Copyright 2014 AMDA - The Society for Post-Acute and Long-Term Care Medicine. Published by Elsevier Inc. All rights reserved.

6. Winter H, Watt K, Peel NM. Falls prevention interventions for community-dwelling older persons with cognitive impairment: A systematic review. *International Psychogeriatrics* 2013;25(2):215-227.

Abstract: **Background:** Globally, falls in older people are a leading cause of injury-related mortality and morbidity. Cognitive impairment is a well-known risk factor for falls in this population group. While there is now a large body of evidence to support effective interventions for falls reduction across care settings, very little is known about interventions in the vulnerable, but increasing population of cognitively impaired community-dwelling older people. Therefore, the purpose of this

systematic review is to investigate interventions designed to reduce falls in community-dwelling, cognitively impaired older adults. Methods: A literature search of databases was conducted to identify original research published in English, which met predefined inclusion and exclusion criteria for effective (non-pharmacological) falls prevention interventions in cognitively impaired community-dwelling people over 65 years of age. Data from the selected papers were extracted into data extraction tables and analyzed according to study characteristics, measures, results, and quality. Results: The review identified 11 studies providing data from 1,928 participants. Interventions included exercise, health assessment and management of risk, multi-component and cognitive behavioral programs, and hip protectors as falls risk reduction strategies. Seven of the selected studies showed an intervention effect in decreasing falls risk; however, only two of these showed a significant improvement in physical performance measures specifically in a cognitively impaired group. Conclusions: The diversity of interventions, study designs, populations, and quality of the studies, which met inclusion criteria, resulted in conflicting evidence and inconclusive results for falls prevention interventions in this highly complex population.
