# Summary

In 2012, the thirteenth round of the Interlaboratory Comparison on POPs in Food was conducted on the determination of the 2,3,7,8-chlorinated dibenzo-p-dioxins (PCDDs) and dibenzofurans (PCDFs) as well as dioxin-like non-ortho and mono-ortho chlorinated biphenyls (PCBs) in three different food items. In addition, laboratories could voluntarily determine and report six PCBs, polybrominated diphenyl ethers (PBDEs) and hexabromocyclododecanes (HBCDs).

The objectives of this interlaboratory comparison study were

- a) To offer a tool for quality assurance for the participating laboratories
- b) To assess the between laboratory reproducibility
- c) To assess the readiness of expert laboratories world-wide to determine levels of chlorinated and brominated persistent organic pollutants in regular foodstuffs

The 2012 study was performed on sample homogenates of reindeer meat, halibut filet and cod liver oil. In addition, six standard solutions were provided containing known concentrations of PCDDs/ PCDFs, non-ortho PCBs, mono-ortho PCBs, PBDEs, indicator PCBs and α-HBCD.

The test materials were sent to 94 laboratories in 36 different countries in January 2012, and results were returned from 90 of these laboratories by the deadline in April. Most laboratories analyzed all the three food items. A draft report was made available on our webpage [www.fhi.no/ILC](http://www.fhi.no/ILC) in July and was presented for the participants and other interested parties at the DIOXIN 2012 Symposium in Cairns, Australia.

This report presents the reported results for all seventeen 2,3,7,8-substituted PCDDs/PCDFs, the non-ortho substituted PCBs #77, 81, 126 and 169 and the eight mono-ortho substituted PCBs #105, 114, 118, 123, 156, 157, 167, 189 in three food items on a fresh weight and lipid weight basis.

In addition, the results for eight PBDEs #28, 47, 99, 100, 153, 154, 183 and 209, six indicator PCBs #28, 52, 101, 138, 153 and 180, and total HBCDs as well as the α-, β- and γ-isomers were reported from those laboratories that voluntarily determined their concentrations.

Non-detected congeners were assigned a concentration corresponding to the reported detection limit except for PBDEs, indicator PCBs and HBCDs where non-detects were removed from the data set.

The consensus concentration (assigned value) for each analyte in the three food samples was determined as follows: The median of all reported concentrations for each analyte was calculated. All values above two times the median were removed from the calculation. The consensus median and consensus mean as well as standard deviation (SD) were calculated from the remaining data.

Toxic equivalents (TEQs) were calculated from the consensus values of individual congeners using the toxic equivalency factors derived by WHO in 1998 and 2005.

Z-scores for the PCDD/PCDF TEQs were calculated for each laboratory using ±20 % of the consensus TEQs (from 2012 on WHO<sub>2005</sub> TEFs were used and not WHO<sub>1998</sub> TEFs as in the previous reports) as a value for target standard deviation ( $\sigma$ ). Further, Z-scores were calculated for the non-ortho PCB TEQ, the mono-ortho PCB TEQ, the total TEQ, the sum of six indicator PCBs, the sum of eight PBDEs, total HBCD, and the three isomers of HBCD and for each single congener in all three matrices.

The consensus values of the standard solutions were calculated as mentioned above with the exception of the removal of all values exceeding ±50 % of the median prior to the final calculation of the consensus median and mean.

The consensus values for the lipid content were calculated by first excluding results deviating more than two SD from the mean of all values, and then re-calculating the median, mean and SD.

For the determination of total TEQs in the three food samples, Z-scores within ±1 were obtained by 79-80 % of the laboratories. The majority of the laboratories (89-95 %) reported results for total TEQ with a trueness of ±40 % for all food samples (Z-score ±2). The relative standard deviation (RSD) calculated for the total TEQ after removal of outliers was 12-16 %. It is therefore concluded that the performance of laboratories worldwide in determining dioxin-like compounds is generally good for the food samples included in this study.

For the different food samples, between 57-62 laboratories reported results for all the six indicator PCBs, 30-36 laboratories reported concentrations for all seven of the tetra- to hepta-BDEs and 22-23 laboratories reported concentrations for BDE-209. The concentrations of the sum of seven PBDEs on fresh weight basis were 18 (14 %), 800 (12 %) and 6442 (14 %) pg/g in reindeer meat, halibut filet and cod liver oil, respectively, with average RSD given in parentheses.

The consensus concentrations for BDE-209 were 16 (n=22), 21 (n=24) and 35 (n=23) pg/g fresh weight

in reindeer meat, halibut filet and cod liver oil, respectively. The corresponding RSD on fresh weight basis were 48, 41 and 75 %. The sums of concentrations on fresh weight basis for six indicator PCBs were 873 pg/g (31 %) in reindeer meat, 8262 pg/g (32 %) in halibut filet and 67005 pg/g (26 %) in cod liver oil. Average RSDs are given in parentheses.

The consensus concentrations calculated for HBCDs are just indicative values as only few laboratories reported results (n=8 to 12).

# Introduction

In order to ensure consumer protection and reduce human exposure to dioxins and dioxin-like PCBs through food consumption, many countries request frequent monitoring of the presence of these toxic pollutants in food and feed. Thus, there is a large demand for chemical laboratories that are able to determine these contaminants at low levels. It is usually required by the authorities that laboratories performing such measurements are accredited according to ISO standards and prove their competence by successful participation in interlaboratory studies.

This study is the thirteenth round of a worldwide interlaboratory comparison study on dioxin-like compounds in food organized by the Department of Exposure and Risk Assessment, Division of Environmental Medicine, Norwegian Institute of Public Health (NIPH), Oslo, Norway.

The exercise took place from January 2012, when the samples were shipped to the laboratories for analysis, to the reporting deadline in April 2012, when the last reports on the results were received. A draft

report was made available to the participants on our webpage (<http://www.fhi.no/ILC>) in July and was presented during the DIOXIN 2012 Symposium in Cairns, Australia.

The main objective of this exercise was to assess the between laboratory reproducibility of dioxin-like compounds analyses in frequently consumed foods and provide a QA/QC instrument for each participating laboratory to contribute to its proficiency. Participants were also asked to voluntarily determine the concentrations of eight PBDEs, six indicator PCBs and HBCD in the food samples in order to assess the readiness of laboratories to analyze these persistent organic pollutants.

All of the participants from previous rounds of this series of "Interlaboratory Comparisons on POPs in Food" were invited to participate. In addition, several other laboratories announced their participation. There was no limit to the total number of participating laboratories. The 90 laboratories that submitted results, and thereby contributed to the study results, are presented in Table 1.

# Design and practical implementation

## Study design and reporting of results

As in the previous rounds of this interlaboratory comparison studies, the test material chosen represented naturally contaminated food samples. The analytes to be determined were all seventeen 2,3,7,8-substituted PCDDs/PCDFs, the four non-ortho substituted PCBs #77, 81, 126 and 169 and the eight mono-ortho substituted PCBs #105, 114, 118, 123, 156, 157, 167 and 189. In addition, laboratories were asked to determine on a voluntary basis eight PBDEs #28, 47, 99, 100, 153, 154, 183 and 209, six indicator PCBs #28, 52, 101, 138, 153 and 180, total HBCDs and it's three isomers ( $\alpha$ -,  $\beta$ -,  $\gamma$ -HBCD). The six PCB congeners belong together with the mono-ortho PCB #118 to the selection of PCBs commonly referred to as ICES-7 (ICES-7: Report of the ICES Advisory Committee, 2010; Book 7).

The analysis should be performed using the laboratories' own methods for sample preparation and instrumental analysis, their own standards and quantification procedures and their own method for lipid determination.

It was recommended that laboratories determine as many as possible of the 2,3,7,8-substituted PCDDs/PCDFs, dioxin-like PCBs, PBDEs, indicator PCBs and HBCDs. The report was to include the determined lipid percent for the reindeer meat and halibut fillet. In addition, the actual sample and lipid amount (g) for each determination should be reported. For each sample, laboratories were to report the found concentration on fresh weight basis for each congener which was detected (e.g. S/N  $\geq 3$ ) as well as the level of determination (LOD, e.g., S/N = 3). Non-detected congeners (e.g. S/N < 3) were to be marked "ND" in the comments column of the Report forms.

In addition, six standard solutions containing known concentrations were to be analyzed using the laboratory's own quantification standards and methods. The standard solutions consisted of the following components:

- 1) seventeen 2,3,7,8-substituted PCDDs/PCDFs
- 2) four non-ortho PCBs
- 3) eight mono-ortho PCBs

- 4) eight PBDEs
- 5) six indicator PCBs
- 6)  $\alpha$ -HBCD

The results were reported in separate forms.

The test materials consisted of reindeer meat, halibut filet and cod liver oil. The laboratories could choose to analyze one, two or all three food samples.

Each participating laboratory was given a specific code by the co-coordinators. In the present report, the participants are presented in the tables and figures by their unique laboratory codes. The participants have access to their own code only and laboratory codes were not revealed to third parties.

When received by the co-coordinators, the raw data from the laboratories were entered into a database. A draft report was generated and made available to all participants on the Internet in July 2012. The draft of the final report was discussed during the DIOXIN 2012 Symposium in August in Cairns, Australia.

## Collection, preparation, and distribution of samples

Samples shipped to the participants comprised one to three of the following:

- Reindeer meat (~100 g)
- Halibut filet (~100 g)
- Cod liver oil (~15 g)

The test materials consisted of natural products and were not fortified with standards.

The reindeer meat was first chopped into manageable pieces. The homogenization was then performed by repeatedly grinding the meat in a grinder. A similar procedure was adopted for the halibut filet. The homogeneity of these materials was tested using an approach developed at NIPH. The rationale for and description of the test method is given in Appendix E. The homogeneity of the cod liver oil was ensured by stirring the material with a magnetic stirrer for 30 minutes at 38°C.

Sub-samples of at least 100 g of reindeer meat (R), 100 g of halibut fillet (H) were placed into carefully cleaned screw-cap polystyrene bottles while 15 g of cod liver oil was placed into amber glass ampoules. All samples were stored at -20°C until shipment. The frozen samples were shipped to the participating laboratories marked as test material R, H and C.

## Statistical analysis

Based on experiences from previous rounds, we have chosen the following approach for the calculation of the consensus concentrations for each of the congeners:

For PCDDs/PCDFs and dioxin-like PCBs congener-by-congener medians were calculated from the food sample data of all reporting laboratories using the detection limit as concentration for non-detected congeners (upperbound concentration).

For PBDEs, indicator PCBs and HBCD, non-detected congeners were removed from the data set prior to consensus calculation. Outliers were defined as those values exceeding twice the median of all values and were removed from the data set.

The consensus values were defined as the median of the remaining data for each congener. In addition, the consensus mean and SD were calculated from this data set for each congener. Those congener data which had been removed prior to consensus calculation are marked in the tables presenting the individual results.

For the standard solutions, outliers were defined as those values outside  $\pm 50\%$  of the median of all reported values. Consensus median, mean and SD were calculated from the remaining data. The consensus of the lipid content was calculated as the mean after removal of values outside  $\pm 2SD$ .

TEQs were calculated from the consensus values for PCDDs/PCDFs, non-ortho PCBs, and mono-ortho PCBs, using the toxic equivalency factors derived by WHO in 1998 and 2005. As the detection limit was used for the concentration of non-detects, these TEQs represent upper bound concentrations.

Z-scores for PCDD/PCDF TEQ as well as for the non-ortho PCB TEQ, the mono-ortho PCB TEQ, the total TEQ (WHO<sub>2005</sub> TEFs) the sum of six indicator PCBs, the sum of eight PBDEs, total HBCDs and for each congener were calculated for each laboratory according to the following equation:

$$z = (x - \bar{X})/\sigma$$

Where  $x$  = reported value;  $\bar{X}$  = consensus value (assigned value);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20 % of the consensus was used, i.e.

Z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

## The final report and certificate

The draft of the final report was prepared by the co-coordinators and published on the web in July 2012. The draft was presented at the DIOXIN2012 Symposium in August in Cairns, Australia.

A certificate, stating the participant's code, will be sent to each participant contributing to the results at the end of 2012. The final report will be made available to the participants in pdf format at <http://www.fhi.no/ILC>.

## Co-ordination

The study was initiated and carried out by the Department of Exposure and Risk Assessment, Division of Environmental Medicine, Norwegian Institute of Public Health, Oslo, Norway. Members of the co-ordination committee were:

# Results

90 laboratories in 36 different countries submitted their results within the dead line and the results will be presented in the following chapters. Any participating laboratory will be able to compare its performance congener by congener with the other laboratories. Since variations in performances are based on several factors, it is recommended that each laboratory carefully evaluates the factors that, favorably or unfavorably, have contributed to its performance. A general reader of the report can without access to the laboratory codes get a general picture of the analytical performance of laboratories world-wide for determining dioxins, dioxin-like PCBs, indicator PCBs, PBDEs and HBCD in regular foods.

In Appendix C the consensus statistics are given on fresh and lipid weight basis for concentrations and TEQ values of individual congeners, a summary of TEQ values for each food item, and the Z-score plots based on a target deviation of  $\pm 20\%$ .

Further, the results of the lipid determinations are presented.

Finally, individual results reported by the laboratories for each congener are given for reindeer meat, halibut filet and cod liver oil in Appendix 2, 3 and 4.

## Summarising comments on results

### PCDDs/PCDFs

#### Analyte solution

Concentrations for PCDDs/PCDFs were reported by 80 laboratories. The average RSD for the 17 congeners was 9.5 % ranging from 8.3 % for 1,2,3,4,6,7,8,9-OCDD to 13 % for 1,2,3,4,6,7,8,9-OCDF. The calculation of Z-scores for the TEQs (target 13.6 pg TEQ/ $\mu$ L) of the PCDD/PCDF standard solution showed that 96 % of the laboratories were within the range of  $\pm 20\%$  of the consensus value. This demonstrates the high quality of the calibration solutions used by the laboratories.

#### Reindeer meat

For the reindeer meat sample, PCDD/PCDF results from 71 laboratories were received. The consensus TEQ (total TEQ based on WHO<sub>2005</sub> TEFs) was 1.0 pg TE/g fresh

weight and 7.9 pg TE/g lipid. The average RSD was 33 % ranging from 21-62 % for 2,3,4,7,8-PeCDF and 1,2,3,4,6,7,8,9-OCDF respectively. Z-scores within  $\pm 1$  were obtained by 77 % of the laboratories and 92 % of the laboratories had Z-scores within  $\pm 2$ .

#### Halibut filet

PCDD/PCDF concentrations in the halibut filet sample were reported by 78 laboratories. The consensus TEQ was 0.43 pg TEQ/g fresh weight and 2.7 pg TEQ/g lipid. The average RSD was 36 % ranging from 18-64 % (2,3,4,7,8-PeCDF and 1,2,3,4,6,7,8,9-OCDF respectively). Z-scores were within  $\pm 1$  for 85 % of the laboratories and within  $\pm 2$  for 92 % of the laboratories.

#### Cod liver oil

For the sample of cod liver oil 77 laboratories determined PCDD/PCDF concentrations. The consensus TEQ was 9.6 pg/g. The average RSD was 40 % ranging from 18-67 % (2,3,7,8-TCDF and 1,2,3,4,6,7,8,9-OCDF respectively). Z-scores for PCDD/PCDF TEQ within  $\pm 1$  were obtained by 80 % of the laboratories and 95 % had Z-scores within  $\pm 2$ .

### Dioxin-like PCBs

#### Analyte solution

The 12 dioxin-like PCBs in the analyte solution were analyzed and reported by 78-79 laboratories. The RSDs for the different congeners were 8.1-10 % with an average of 9.2 %.

#### Reindeer meat

Dioxin-like PCB concentrations in reindeer meat were reported from 71 laboratories. The concentrations of the 12 congeners varied between 0.61 pg/g fresh weight (CB-81) and 320 pg/g fresh weight (CB-118). The average RSD for concentrations of individual dioxin-like PCB congeners on fresh weight basis was 24 % ranging from 18 % for CB-105 to 35 % for CB-123.

The dioxin-like PCBs contribute 68 % to the total TEQ in the sample with CB-126 as the main contributor (64 %).

## Halibut filet

The number of laboratories that measured and reported dioxin-like PCB concentrations in halibut filet were 78. The concentrations ranged from 0.78 pg/g fresh weight for CB-81 to 1532 pg/g fresh weight for CB-118. The average RSD for concentrations of individual dioxin-like PCB congeners on fresh weight basis was 22 % ranging from 16 % for CB-105 to 41 % for CB-123.

The dioxin-like PCBs contribute to about 69 % of the total TEQ in the sample with CB-126 as the main contributor (58 %).

## Cod liver oil

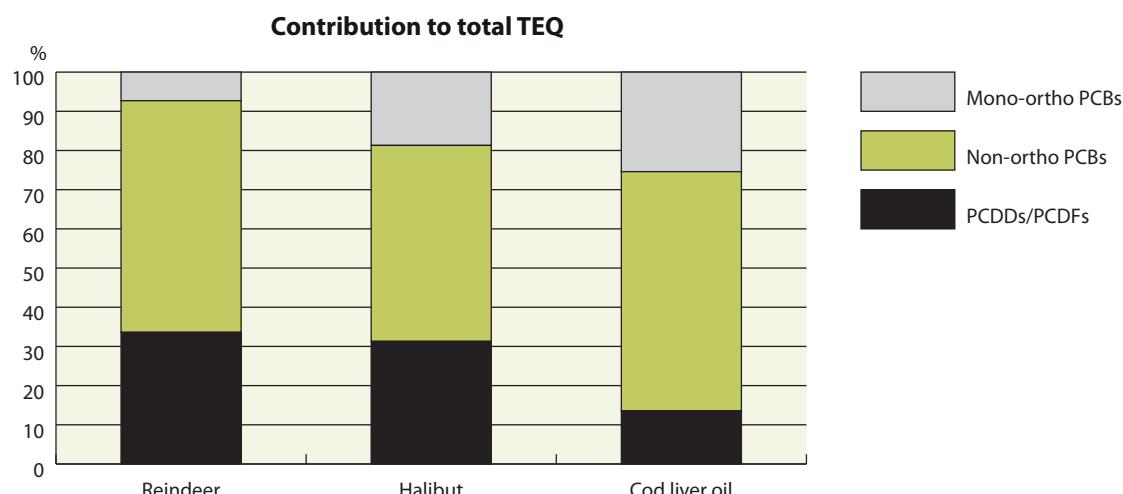

Dioxin-like PCBs in cod liver oil were reported by 79 laboratories. Levels were ranging from 4.2 pg/g fresh weight for CB-81 to 13600 pg/g fresh weight for CB-118. The average RSD for concentrations of individual dioxin-like PCB congeners on fresh weight basis was 22 % ranging from 15 % for CB-105 to 38 % for CB-81. The contribution of the dioxin-like PCBs to the total TEQ was about 85 % with CB-126 as the main contributor (73 %).

## Total TEQ

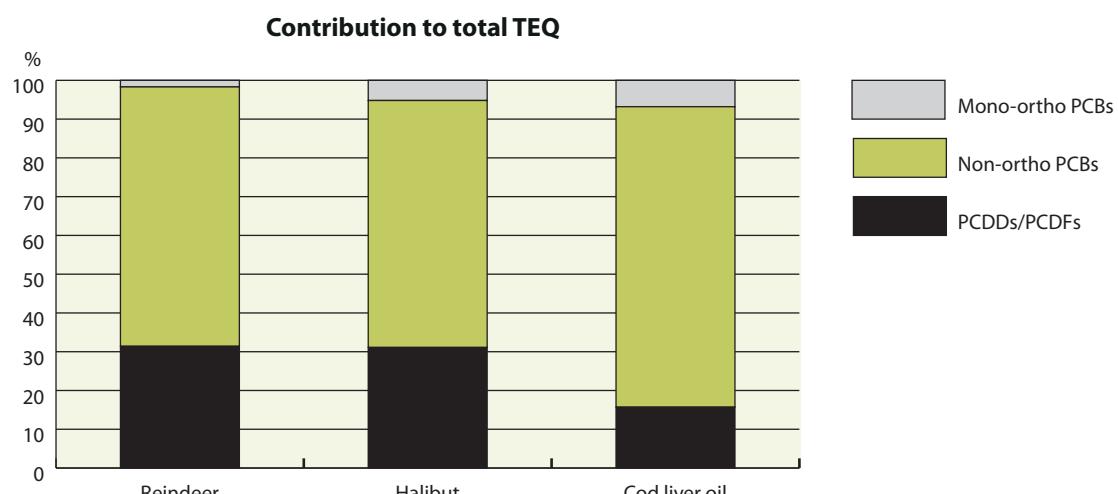

The total TEQ for reindeer meat was 1.0 pg TEQ/g fresh weight and 7.9 pg TEQ/g lipid weight (WHO TEF<sub>2005</sub>). For halibut filet the total TEQ was 1.4 pg TEQ/g fresh weight and 8.7 pg TEQ/g lipid weight, and for cod liver oil 9.6 g TEQ/g.

The RSDs for total TEQs on fresh weight basis calculated from the RSD of individual congeners were 15 % for reindeer meat, 10 % for halibut filet and 10 % for cod liver oil.

In Figure 1 and 2 the contribution of the three groups of dioxin-like compounds is depicted based on WHO TEF<sub>1998</sub> and WHO TEF<sub>2005</sub>, respectively. For all three food-items included in this study the dioxin-like PCBs contributed to 68 % or more of the total TEQs (using WHO TEF<sub>2005</sub>), demonstrating the importance of PCBs for the determination of the total TEQ related toxic potency of food samples.

**Figure 1.** The contribution of PCDDs/PCDFs, non-ortho PCBs and mono-ortho PCBs to the total TEQ calculated using the WHO<sub>1998</sub> TEFs, in the three food samples.

**Figure 2.** The contribution of PCDDs/PCDFs, non-ortho PCBs and mono-ortho PCBs to the total TEQ calculated using the WHO<sub>2005</sub> TEFs, in the three food samples.

## *Indicator PCBs*

### *Analyte solution*

65 laboratories reported indicator PCBs in the analyte solution. The average RSD was 12 % ranging from 11 to 13 %.

### *Reindeer meat*

For the reindeer meat sample indicator PCB results were received from 58 laboratories. The concentrations were varying between 14 pg/g fresh weight (CB-52) and 445 pg/g fresh weight (CB-153). The RSDs were ranging from 23 to 42 % for CB-180 and CB-52 respectively, with an average of 31 % for all indicator PCBs. The consensus median for the sum of indicator PCBs was 873 pg/g fresh weight.

### *Halibut filet*

Within the deadline, 61 laboratories reported results of indicator PCBs in the halibut filet sample. The concentrations ranged from 368 pg/g fresh weight (CB-28) to 2621 pg/g fresh weight (CB-153) with a consensus median for the sum of indicator PCBs of 8262 pg/g fresh weight. The average RSD was 31 %, ranging from 29 to 39 %.

### *Cod liver oil*

Results were obtained from 63 laboratories. The concentrations of indicator PCBs in the cod liver oil sample were ranging from 2109 pg/g fresh weight (CB-28) to 24000 pg/g (CB-153) and the consensus median for the sum was 67005 pg/g fresh weight. The average RSD was 26 %, ranging from 20 to 36 %.

## *PBDEs*

### *Analyte solution*

The tri- to hepta-PBDE standard solution was analyzed by 39 laboratories and 26 laboratories reported values for BDE-209. The RSDs were between 9.4-13 % for all congeners

### *Reindeer meat*

The PBDE concentrations in reindeer meat were reported by 31 laboratories, except for BDE-209 for which 22 results were received. The consensus concentrations were in the range from 0.51 pg/g fresh weight for BDE-28 to 7.7 pg/g fresh weight for BDE-153. The consensus concentration for BDE-209 was 16 pg/g fresh weight. The sum of tri- to hepta-BDEs was 18 pg/g fresh weight. The range of RSDs on fresh weight basis was 19-48 %, with an average of 37 % including BDE-209.

### *Halibut filet*

Within the deadline, 37 laboratories had reported results for tri- to hepta-PBDEs in halibut filet and 24 laboratories had reported results for BDE-209. The consensus concentrations varied between 0.55 pg/g fresh weight (BDE-183) and 544 pg/g fresh weight (BDE-47). The concentration for BDE-209 was 21 pg/g fresh weight. The sum of tri- to hepta-BDEs was 800 pg/g fresh weight. The RSD calculated from the concentrations on fresh weight ranged from 15-49 %, with an average of 25 % for PBDEs including BDE-209

### *Cod liver oil*

37 laboratories reported results for tri- to hepta-PBDEs in cod liver oil, and 23 reported results for BDE-209. The concentrations varied between 5.5 pg/g fresh weight (BDE-183) and 4560 pg/g (BDE-47). The concentration for BDE-209 was 35 pg/g. The sum of tri- to hepta-BDEs was 6442 pg/g fresh weight. The RSDs for the individual congeners were ranging from 17 to 43 % with an average of 32 % including BDE-209.

## *HBCDs*

Also in this round of the study, total HBCDs and the isomers α-, β- and γ-HBCD could be determined and reported. A total of 14 laboratories reported α-HBCD in the standard solution and 13 laboratories reported one or more of the three isomers in the food samples. The consensus concentrations for the sum of individual HBCD isomers were 7.2 pg/g fresh weight for reindeer meat, and 370 and 5922 pg/g fresh weight for halibut filet and cod liver oil, respectively. Since only few laboratories reported HBCDs, these results must be regarded as indicative values.

## *Lipid content*

The mean and RSDs (in parentheses) for the lipid contents of the food samples were calculated to be 13 % (15 %) for reindeer meat and 16 % (12 %) for halibut filet. Cod liver oil was assumed to consist of 100 % lipids.

# Acknowledgements

The laboratories are acknowledged for their participation in this interlaboratory comparison and their interest in its overall objectives, thereby making it clear that they value good analytical performance. All the individual analysts are acknowledged for their contributions to the results.

We are grateful to Cambridge Isotope Laboratories, Inc. for providing the standard solutions for this interlaboratory study. We thank Aage Pedersen AS, Tana, for providing the reindeer meat and The National Institute of Nutrition and Seafood Research (NIFES), Bergen, for providing the halibut fillet. The cod liver oils were a kind gift from Axellus AS, Oslo.

## **Appendix B:**

Study announcement and  
instructions for participants

## **Announcement for Interlaboratory Comparison on POPs in Food 2012**

---

### **Introduction**

We hereby announce the 13<sup>th</sup> round of the Interlaboratory Comparison on the Determination of POPs in Food. The study is open for academic, regulatory as well as commercial laboratories world-wide. The organizer of this study is the Department of Exposure and Risk Assessment, Division of Environmental Medicine, Norwegian Institute of Public Health (NIPH), Oslo, Norway.

The study is scheduled to take place from January to April 2012. A draft report will be available prior to the evaluation meeting which will take place at the Dioxin 2012 Symposium in August, Cairns, Australia. The final report will be available to the participants by December 2012 together with a certificate for participation.

### **Objectives**

The objectives of this exercise are to assess the interlaboratory consistency in results from analyses of dioxins, PCBs, PBDEs and HBCD in regular foods known to contribute to the intake in the general population and to assess the world-wide readiness and capacity in analysing these halogenated persistent organic pollutants in food. The study also serves as a quality assurance instrument for the participating laboratories.

### **Participants**

We encourage all laboratories world-wide working in this field to participate and assess their analytical performance. Participants are requested to completely fill out the Registration Form and mark the desired sample types and what analytes they intend to determine.

### **Analytical requirements**

In this interlaboratory comparison, all the seventeen 2, 3, 7, 8-substituted PCDDs and PCDFs, the four non-ortho PCBs, CB-77, 81, 126 and 169 as well as the eight mono-ortho PCBs, CB-105, 114, 118, 123, 156, 157, 167, and 189 will be assessed. In addition, you are invited to determine six marker PCBs, eight PBDEs and HBCD. The concentration of the following congeners can be reported: CB-28, 52, 101, 138, 153 and 180 and BDE-28, 47, 99, 100, 153, 154, 183 and 209. The concentration of α-HBCD, β-HBCD and γ-HBCD as well as the total of these isomers will also be assessed. The test materials consist of three fresh food homogenates. You can choose to analyse one, two or all three of the food items. We encourage you to determine as many analytes as possible. You are further requested to determine and report the lipid content of the foods.

We also include standard solutions of all analytes that should be analysed as solutions of known concentration, which may be used to check your own calibration solutions.

### **Test material**

The test materials consist of three unfortified natural food product homogenates, Reindeer meat (labelled R) ~100 g, Halibut filet (labelled H) ~100 g and Cod liver oil (labelled C) ~15 g, and will be distributed by an international courier service to the participating laboratories.

**Please note:**

**In order to avoid delay at customs, please inform us if there are import restrictions for any of these samples in your country.**

**Instructions for analysis and reporting**

Further detailed instructions and reporting forms will be sent by e-mail simultaneously with the dispatch of the samples in January.

In short, laboratories should:

- use their own standard operation procedures for extraction clean-up and instrumental determination
- use their own reference standards for identification and quantification
- report a single concentration for each analyte in each food matrix determined on fresh weight basis
- report limits of detection for all measured analytes in each food item
- report the lipid content

**Time schedule**

Announcement	<b>December 2011</b>
Return of registration form	<b>December 16, 2011</b>
Shipment of test material	<b>January 16, 2012</b>
Confirmation of receipt of test material by participant	<b>Within 7 days</b>
<b>Reporting of test results <sup>a)</sup></b>	<b>April 20, 2012</b>
Publication of draft report on web-site	<b>August 2012</b>
Evaluation meeting at Dioxin 2012 in Cairns, Australia	<b>August 2012</b>
Final report available to all participants	<b>November 2012</b>

- a) Please be sure that your results are reported on time as there will be **no extension of the deadline.**

**Participation fee**

To all laboratories that have received the test materials, a corresponding invoice in Norwegian kroner (NOK) will be sent. The participation fee for any combination of the analytes in one food item is 9 000 NOK, for two food items 11 200 NOK, and for the complete set of all three food items the fee is 13 400 NOK.

## **Interlaboratory Comparison on Dioxins in Food 2012**

---

### **Instructions for participants**

**January 2012**

#### **1. Introduction**

This is the 13<sup>th</sup> Round of the Interlaboratory Comparison Study on the Determination of POPs in Food organised by the Department of Exposure and Risk Assessment, Norwegian Institute of Public Health, Oslo, Norway. The objective of this exercise is to assess the interlaboratory comparability of the results from analyses of all dioxins and dioxin-like PCBs included in the WHO-TEF schemes in regular foods. Participants may also determine and report concentrations of six marker PCBs, eight polybrominated diphenylethers (PBDEs) and hexabromocyclododecane (HBCD). The exercise serves as a quality assurance instrument for the participating laboratories. A further objective is to assess the world-wide readiness and capacity for the determination of dioxin-like compounds, marker PCBs, PBDEs and HBCD in food. Instructions for the analysis and submission of results are given below.

**Please read these instructions carefully before starting the experimental work.**

The participating laboratories will collaboratively assess the interlaboratory comparability in the analytical performance for determination of:

- dioxins and furans: all seventeen 2,3,7,8-substituted PCDDs and PCDFs
- non-ortho PCBs: CB-77, 81, 126 and 169
- mono-ortho PCBs: CB-105, 114, 118, 123, 156, 157, 167 and 189.
- marker PCBs: CB-28, 52, 101, 138, 153 and 180
- PBDEs: BDE-28, 47, 99, 100, 153, 154, 183 and 209
- HBCD α-HBCD, β-HBCD, γ-HBCD and total HBCD

in samples of Reindeer meat (R), Halibut filet (H) and Cod liver oil (C). The mentioned analytes should also be determined in the respective six standard solutions. For HBCD, concentrations of α-HBCD, β-HBCD and γ-HBCD as well as the total of these isomers will be assessed. Both results from GC-MS and LC-MS or LC-MS/MS are welcome.

#### **2. Participants**

A list of participants is attached. Ninety-one laboratories have announced their participation in the study.

### **3. Design of the study**

#### **3.1 Test materials**

##### Samples

One standard solution of each:

- EDF-5008-50 with PCDDs/PCDFs at concentrations 2:5:10 pg/µl for tetra:penta:hexa-hepta:octa chlorinated dibenzo-p-dioxins/-dibenzo furans respectively
- EC-4986/1000 with non-ortho PCBs at concentration 10 pg/µl
- EC-4987/100 with mono-ortho PCBs at concentration 100 pg/µl
- EC-5179/50 with marker PCBs at concentration 100 pg/µl
- EO-5103/100 with PBDEs at concentration 25 pg/µl, except BDE-209 at 100 pg/µl
- ULM-4834-S/100 with α-HBCD at a concentration 500 pg/µl

One sample of each

- ca. 100 g reindeer meat
- ca. 100 g halibut filet
- ca. 15 g cod liver oil, lipid content 100%

##### Fortification

The samples are prepared from regular market foods. There is no fortification or spiking of the PCDD, PCDF, PCB, PBDE or HBCD analytes in the food samples.

##### Shipment

The samples are fresh frozen food homogenates. They are distributed by DHL and should reach the receiving laboratory in good condition within a few days. The airwaybill numbers will be made available for the participants to trace the shipment at <http://www.dhl.com>.

#### **3.2 Coding**

##### Coding of laboratories

Upon arrival of the samples in the participant's laboratory, the Microsoft excel file named "Participant confirmation", shall be filled in and **immediately** returned to the co-ordinators by e-mail or telefax. The code of the laboratory will then be given by the co-ordinators. The laboratory codes will not be revealed to the other participants or to third parties.

##### Coding of samples

Reindeer meat	R
Halibut filet	H
Cod liver oil	C

The above sample coding is marked on the sample bottles.

#### **3.3 Analytical procedure**

##### Methods to be used

Laboratories shall use

- their own methods for sample preparation and instrumental analysis
- their own internal- and quantification standards
- their own lipid determination procedure

### Standard solutions

The standard solutions should be analysed using the laboratory's own quantification standards and methods and the results shall be reported.

### General

Beware of the high risk of background contamination and positive blank values when analysing food samples with levels of dioxins, PCBs, PBDEs and HBCD in the low ppt range.

Use sample size according to expected levels of dioxins for the determinations in order to achieve a detection level that leaves as few as possible analytes as non-detected. The sample amount dispatched is not meant for replicate analyses.

The samples might become inhomogeneous during freezing and transport. Re-homogenise all received material of each food item before any portion is taken out for analysis.

## **4. Reporting**

### 4.1 Results to be reported

Laboratories are recommended to report as many as possible of the congeners mentioned in chapter 1.

The reports must include the determined lipid percent for reindeer meat and halibut fillet. Also, the actual sample amount (g) for each determination must be reported.

The analytical report must include concentrations for all the congeners in all the samples on fresh weight basis, see Report forms B, C, D for PCDD/PCDF and dioxin-like PCBs and Report form 2, 3, 4 for marker PCBs, PBDEs and HBCD.

Laboratories must report one concentration on fresh weight basis for each congener which is detected ( $S/N \geq 3$ ), as well as the limit of determination (LOD,  $S/N = 3$ ) for each sample. Non-detected congeners ( $S/N < 3$ ) must be marked ND in the Comments column of the Report form. **Please note that the LOD will be used as concentration of non-detected congeners.**

### 4.2 Checklist

Please use the attached checklist before returning the Report forms with your results.

### 4.3 Submitting results

Three Microsoft Excel files are provided to each participant comprising:

#### **Participants confirmation**

- confirmation of receiving test materials

#### **Report form dioxins and dioxinlike PCBs**

- analytical data, Report forms A, B, C and D

#### **Report form marker PCBs, PBDEs and HBCD**

- analytical data, Report forms 1, 2, 3 and 4

Participants are requested to submit their reports electronically to avoid possible transcription errors.

**Please, do not alter rows or columns in the original Report forms!**

The electronic report shall be sent to [dioxin@fhi.no](mailto:dioxin@fhi.no) within the deadline.

If necessary, a hard copy of the Report forms can be provided. Please contact one of the co-ordinators. If a hard copy report is used, it shall either be faxed to: + 47 21 07 66 86 or mailed to:

Norwegian Institute of Public Health  
att. Georg Becher  
P.O. Box 4403 Nydalen  
N-0403 Oslo, Norway

**Deadline**

**The reports must be in our hands no later than April 20, 2012** to enable us to prepare the draft report for the Dioxin 2012 Symposium in Cairns, Australia. There will be no extension of this deadline. A confirmation for the receipt of your results will be sent to you by e-mail within a week.

**5. Statistical evaluations**

Prior to the final report, a draft version will be prepared based on the data reported by April 20th. The co-ordinators will calculate mean, median and between-laboratory standard deviations for each congener. Outliers will be removed, and consensus values will be calculated. In case of extreme deviation from normal distribution, appropriate procedures will be used to get a best available estimate of the true value. For the dioxin-like compounds, TEQ values will be calculated for each laboratory and a consensus TEQ value based on the consensus of the congeners. Z-scores will be calculated for laboratories' results for PCDD/PCDF TEQs and PCB TEQs.

Statistical results based on the reported data as well as other important information from the evaluation of the data, will be discussed during a consultation meeting in August at the Dioxin 2012 Symposium in Cairns, Australia.

**6. Final report**

The final report will be prepared by the co-ordinators. All participants will be presented by their laboratory code. A draft will be published on the Internet in the beginning of August. The results will be discussed during the Dioxin 2012 Symposium in Cairns, Australia. The final report will be available by November 2012. The report will be available in an electronic version on <http://www.fhi.no>. Certificates of participation in the study will be given to all laboratories submitting results.

## 7. Fee

To all laboratories that have received the materials, an invoice will be sent. The participation fee for any combination of the 29 dioxin-like congeners, six marker PCBs, 8 PBDEs and HBCD is

- NOK 9000 for one food item
- NOK 11200 for two food items
- NOK 13400 for the complete set of all three food items.

Up to six standard solutions will be distributed free of charge to all participants, dependent on which analytes the participating laboratories intend to determine.

Invoices will be sent out after we have received the Participant confirmation from the participants.

## 8. Time schedule

Announcement	<b>December 2011</b>
Return of registration form	<b>December 16, 2011</b>
Shipment of test material	<b>January 23, 2012</b>
Confirmation of receipt of test material by participant	<b>Within 7 days</b>
Reporting of test results <sup>a)</sup>	<b>April 20, 2012</b>
Publication of draft report on web-site	<b>August 2012</b>
Evaluation meeting at Dioxin 2012 Cairns, Australia	<b>August 2012</b>
Final report available to all participants	<b>November 2012</b>

- a) Please be sure that your results are reported in time as there will be no extension of the deadline.

## **Checklist**

In order to avoid possible misunderstandings and errors when reporting your results, we here give a list of possible pitfalls. Please, check this list and your Report forms before reporting your results.

- Are the results for each congener filled out in the correct order? Be especially aware of 2,3,4,6,7,8- and 1,2,3,7,8,9-HxCDF, and PCB 81.
- Are all congener results reported in pg/ $\mu$ l for standards and pg/g for samples?
- Are both concentration and LOD reported for each congener?
- Are sample amount and measured lipid content filled in?
- Are not detected congeners marked with ND in the Comments column?

## Appendix C:

### Summary results

Consensus of congener concentrations

Consensus of TEQ values

Consensus statistics

Laboratories' reported TEQs

## Presentation of results for lipid determination

Removal of outliers and calculation of consensus were done by the following procedure:

1. The mean was calculated from all the reported data.
2. Values outside a range of  $\pm 2 \times$  the standard deviation of this mean were defined as outliers and removed from the data set.
3. Mean, standard deviation and median were re-calculated from the remaining data. This mean was called consensus.

The diagram shows the reported data with consensus and consensus  $\pm$  the new standard deviation  $\times 2$ .

### Z-Scores of lipid content

Z-scores of lipid content were calculated for each laboratory according to the following equation:

$$z = (x - X)/\sigma$$

where  $x$  = reported value;  $X$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

Homogeneity testing

# **Homogeneity testing of test materials for “Interlaboratory Comparison on Dioxins in Food” organised by the Norwegian Institute of Public Health**

## **Introduction**

The International Harmonized Protocol for the Proficiency Testing of Analytical Chemistry Laboratories (Pure Appl Chem 2006;78:145-96) states that “The bulk material prepared for the proficiency test must be sufficient homogeneous and stable, in respect of each analyte, to ensure that all laboratories receive distribution units that do not differ to any consequential degree in mean analyte concentration. The scheme provider must clearly state the procedure used to establish the homogeneity of the test material”.

The protocol requires that the variation in composition among the distributed units is negligible in relation to variation introduced by the measurements conducted by the participants of the proficiency test (PT). The estimated variation between the samples ( $s_{sam}$ ) should be less than 30% of the target standard deviation ( $\sigma_p$ ), i.e.,  $s_{sam} < 0.3 \sigma_p$ .

Further the protocol states that homogeneity testing is required to reassure the participants in proficiency testing schemes that the distributed units of the test material are sufficiently similar. The test specified calls for the selection of ten or more units at random after the putative homogenized material has been split and packaged into discrete samples for distribution. The material from each sample is then analyzed in duplicate, under randomized repeatability conditions (that is, all in one run) using a method with sufficient analytical precision. The value of  $\sigma_{sam}$  is then estimated from the mean squares after one-way analysis of variance (ANOVA).

Much depends on the quality of the analytical results of the homogeneity testing. If the analytical precision ( $\sigma_{an}$ ) of the homogeneity test is not small, important sampling variation may be obscured by analytical variation. We may get a non-significant result when testing for heterogeneity, not because it is not present, but the test has no power to detect it. It is recommended that the analytical (repeatability) precision of the method used in the homogeneity test should satisfy  $\sigma_{an} < 0.5 \sigma_p$ .

## **Consequences for the Interlaboratory Comparison on Dioxins in Food**

Below follows the consequences for the Interlaboratory Comparison on Dioxin in Food;

### **1.**

The protocol recommends duplicate analysis of at least 10 distribution units. Due to limited amount of test material in each distribution unit and the requirement for sufficiently low analytical standard deviation, the test analysis has to be restricted to PCB, e.g., 6 indicator PCB or CB-153. It is, however, questionable whether analysis of indicator PCB also reflects the distribution of dioxins and other contaminants in the sample, as the test material is often prepared by mixing specifically contaminated material with background contaminated material in order to achieve a sufficient contamination level. Therefore, the distribution of PCBs in the sample might not be relevant for the distribution of dioxins in the sample. The analytical precision of the method used in the homogeneity test should be less than half of the target standard deviation, i.e.,  $\sigma_{an} < 0.5 \sigma_p$ . For determination of dioxins, the target standard deviation may be approximated by the requirement for trueness (Commission Regulation (EC) No 1883/2006) of  $\pm 20\%$  for total TEQ, i.e., the analytical precision should be less than 10%. This is unrealistic to achieve for the determination of dioxins.

**2.**

The homogeneity testing using, e.g., the determination of indicator PCBs, requires the analysis of at least 60 samples prior to shipment of the distribution units to the participants. This causes problems for the time schedule of the sample preparation and involves high costs.

**3.**

The laboratory conducting the homogeneity test on PT analytes would have access to the test material and knowledge of contamination levels prior to the start of the PT and would therefore not be qualified for participation in the PT.

### **Conclusion**

A valid testing of homogeneity of the test materials of the Interlaboratory Comparison (ILC) on Dioxins in Food with respect to the distribution of dioxins and dioxin-like PCBs is not guaranteed using indicator PCBs. It is doubtful that the analytical precision is small enough to detect a lack in sufficient homogeneity. Given the need for annually testing three different matrices for homogeneity, alternative, rapid and low cost homogeneity tests using surrogate should be applied.

### **Present approach for homogeneity testing for the ILC on Dioxins in Food**

The Harmonized Protocol states under Chapter Testing for sufficient homogeneity: “Tests for sufficient homogeneity are in practice never wholly satisfactory... However, given that sufficient homogeneity is a reasonable prior assumption (because proficiency testing scheme providers do their best to ensure it), and that the cost [and time-consumption] of testing for it is often high, it is sensible to make the main emphasis the avoidance of “Type 1 errors” (that is, false rejection of a satisfactory material).

Having this in mind and the facts that it is impossible to determine all analytes for homogeneity testing of food test material and that a single indicator analyte not necessarily reflects the distribution of the other analytes, we have developed an approach that ensures that the test material is thoroughly blended and evenly distributed among the individual test bottles. The homogeneity testing of solid samples is based on the principle of measuring electrolytic conductivity after addition of sodium chloride to a small portion of the coarsely blended test material. A demonstration of homogeneous distribution of the added salt in the sub samples would indicate our ability to evenly blend the food matrix, i.e., with this approach we ensure the efficiency of our blending procedure. This is especially of importance when blending highly contaminated food matrices with background contaminated food matrices.

When testing homogeneity of the food samples, sodium chloride was added to about 10% of the test material in such an amount that the conductivity was about doubled compared to the natural conductivity. This sub-sample was added to the total sample. For example, to 1 kg of homogenised chicken meat, 150 g NaCl were added resulting in an addition of 1% NaCl to the final test material of 15 kg. Conductivity measurements are performed as follows: boiling water is added to 10.0g of the test material, and the resulting dispersion is ultrasonicated. After centrifugation, the extract is filtered through folded paper filters and allowed to cool to room temperature. The electrolytic conductivity of the water extract is measured using a conductivity meter.

Homogeneity of the test material was demonstrated by comparing the conductivity in water extracts of 10 samples from the same bottle (variation within bottles), and in extracts from 10 different bottles (variation between bottles).

### **Example**

As an example, the relative standard deviation (RSD) of 10 conductivity measurements within a sample bottle containing chicken meat homogenate was 2%. The RSD for the measurement of samples from 10 different, randomly selected bottles was 3%. The contribution of the inhomogeneity to the total variation, calculated from  $RSD_{inhomogeneity}^2 = RSD_{between}^2 - RSD_{within}^2$ <sup>1</sup> was 2.2% and hence small and acceptable. The total uncertainty for the determination of PCDD/Fs is usually considerably larger, so the measured contribution of inhomogeneity to the total uncertainty can be neglected

<sup>1</sup>G. Becher, L.S. Haug, C. Thomsen, World-wide comparison on the quality of analytical determinations of PCDDs/PCDFs and dioxin-like PCBs in food, *Talanta* 63 (2004) 1115-1122.

## **Appendix 1:**

Presentation of results  
for analyte solution

## Appendix 1: Presentation of results: Analyte solution

### Statistic calculations for PCDDs, PCDFs, dioxin-like PCBs, indicator PCBs, PBDEs and $\alpha$ -HBCD

The analyte solution contained

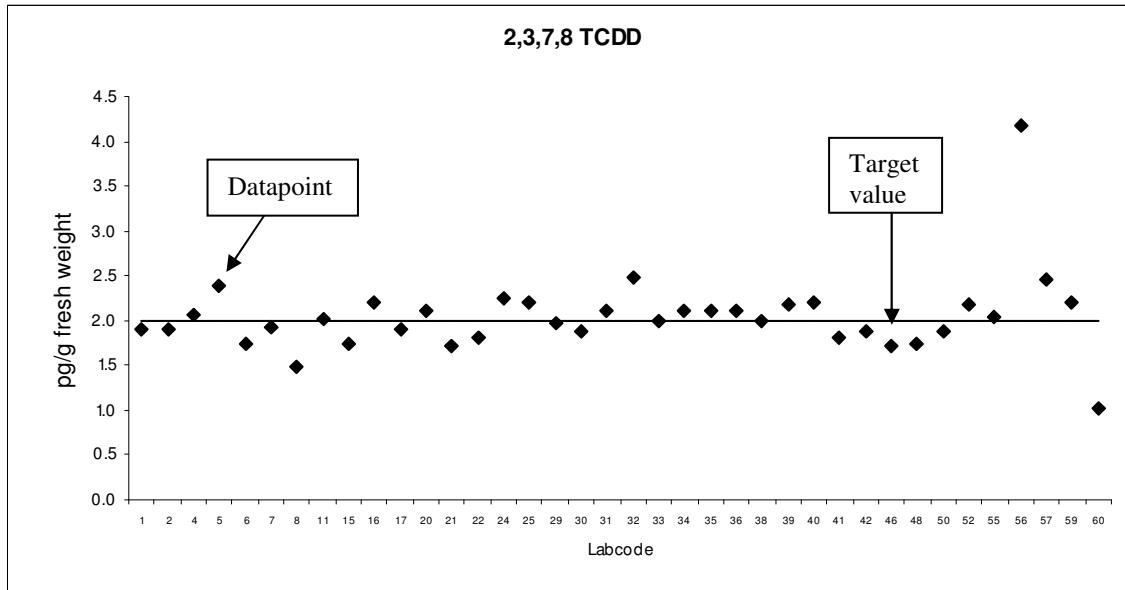

- PCDDs/PCDFs at concentrations of 2:5:10 pg/ $\mu$ l for tetra:penta-hexa-hepta:octa chlorinated dibenzodioxins/furans respectively.
- Non-ortho PCBs at concentration of 10 pg/ $\mu$ l.
- Mono-ortho PCBs and indicator PCBs at concentration of 100 pg/ $\mu$ l.
- PBDE at a concentration of 25 pg/ $\mu$ l, except BDE-209 at 100 pg/ $\mu$ l.
- $\alpha$ -HBCD at a concentration of 500 pg/ $\mu$ l.

These concentrations are called the congeners' target value.

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

1. The median was calculated from all the reported data.
2. Values outside a range of 50 % to 150 % of this median, were defined as outliers and removed from the data set.
3. Median, mean and standard deviation were re-calculated from the remaining data. This median and mean were called consensus median and mean.

The diagram shows the target value and the reported data. Values outside a range of 50 % to 150 % of "median of all values", were defined as outliers and are not shown in the plot.

### Z-Scores of individual congeners

Z-scores of each congener were calculated for each laboratory according to the following equation:

$$z = (x - \bar{X})/\sigma$$

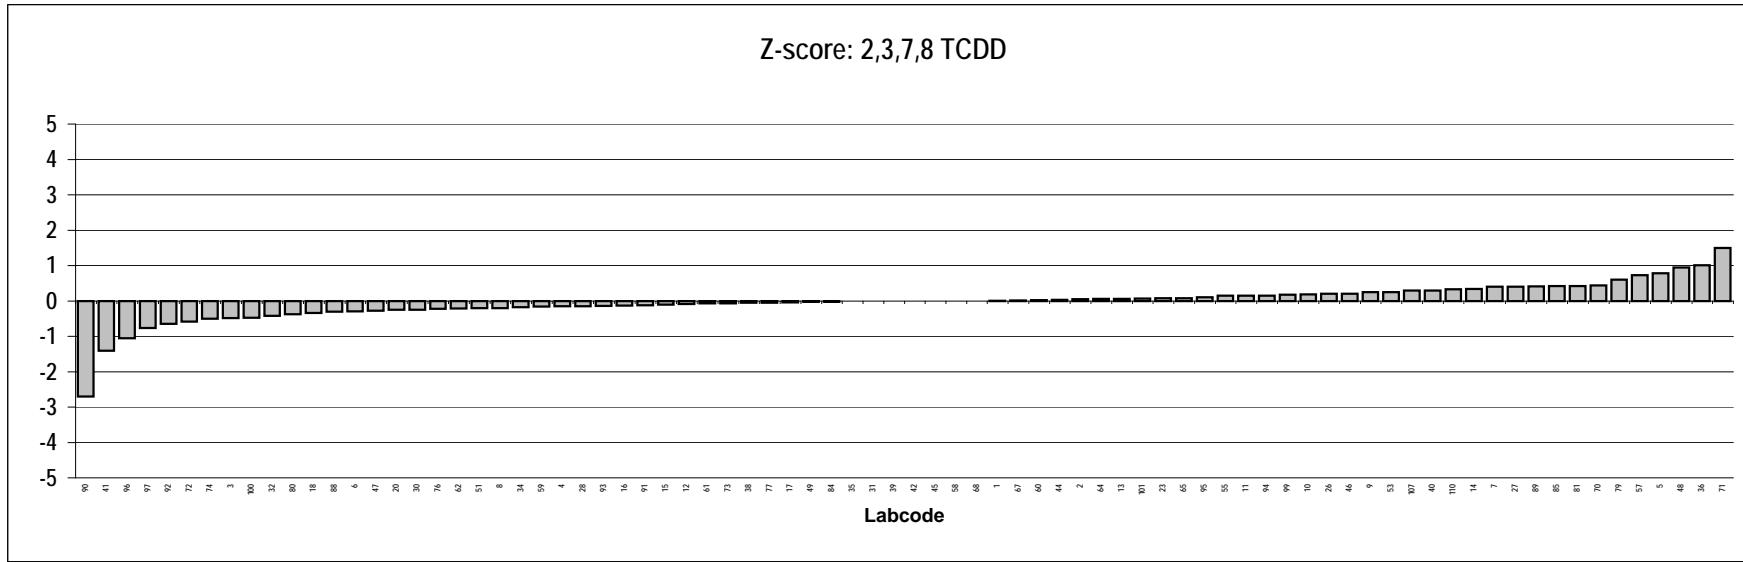

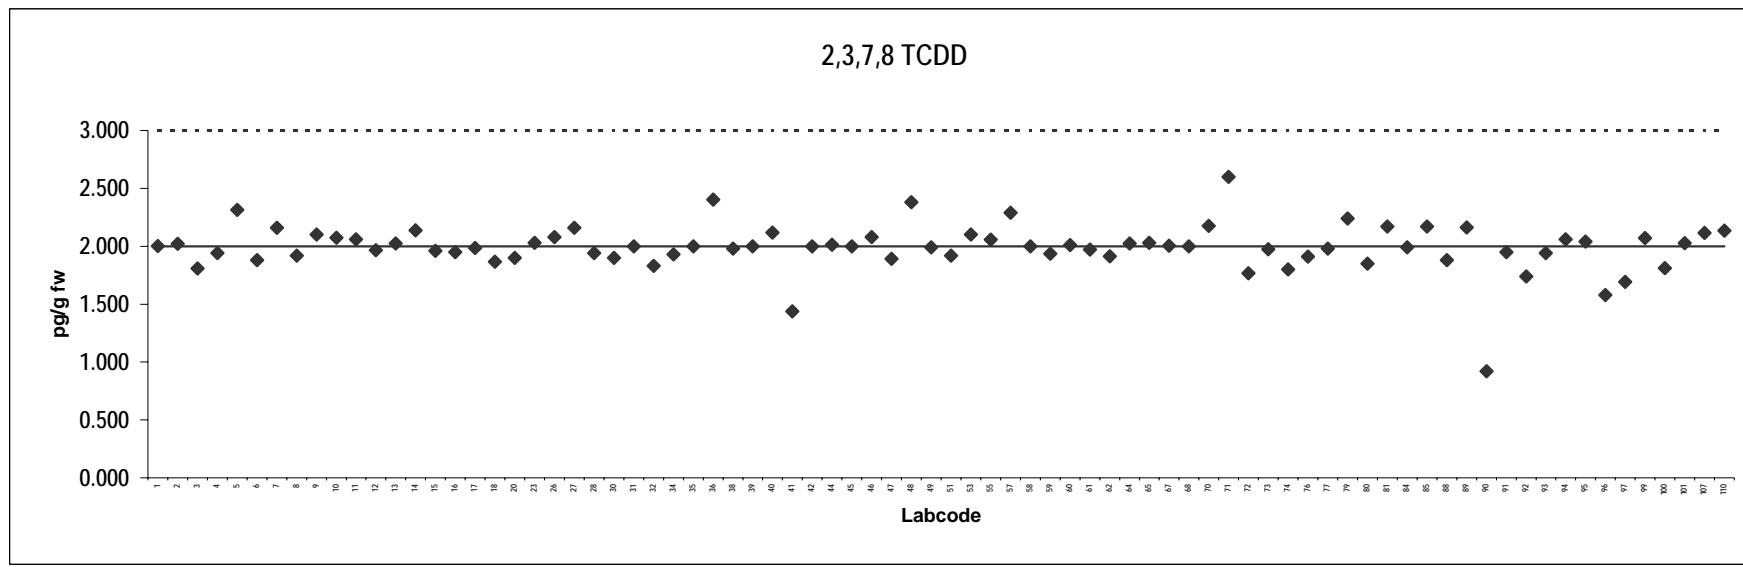

Where  $x$  = reported value;  $\bar{X}$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

## **Appendix 2:**

Presentation of results  
for reindeer meat

## Appendix 2: Presentation of results: Reindeer meat

### Statistic calculations for PCDDs, PCDFs and dioxin-like PCBs

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

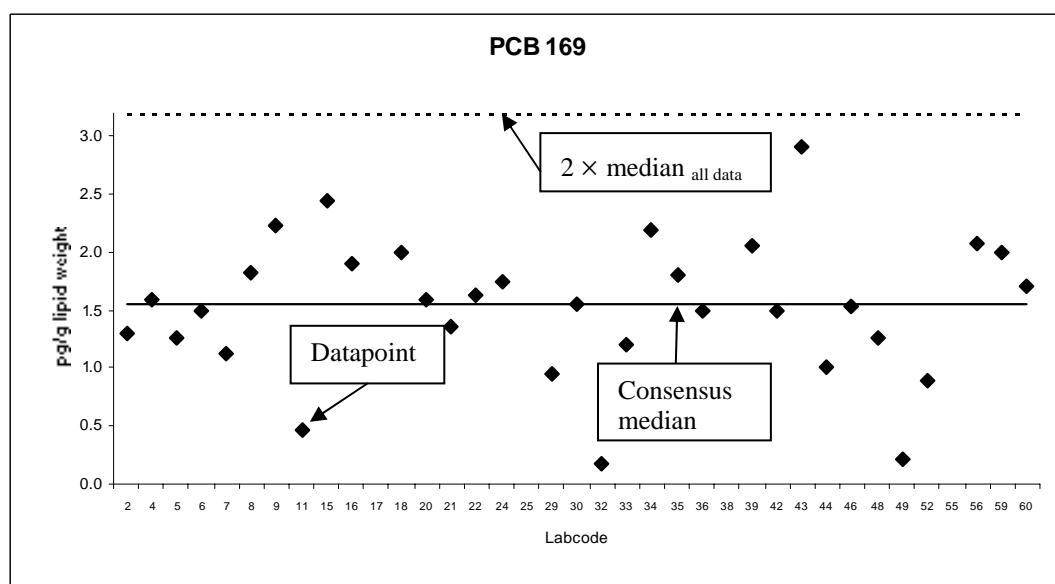

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners.
2. Values exceeding  $2 \times$  this median, were defined as outliers and removed from the data set.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.

### Statistic calculations for indicator PCBs, PBDEs and HBCD

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners (NDs).
2. Values exceeding  $2 \times$  this median, were defined as outliers and removed from the data set. The NDs were also removed.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.
4. For comparison, median, mean and standard deviation were also calculated without removing NDs.

The diagram shows the reported data up to approximately the limit for outliers ( $2 \times$  the first median).

### Z-Scores of individual congeners

Z-scores of each congener were calculated for each laboratory according to the following equation:

$$z = (x - X)/\sigma$$

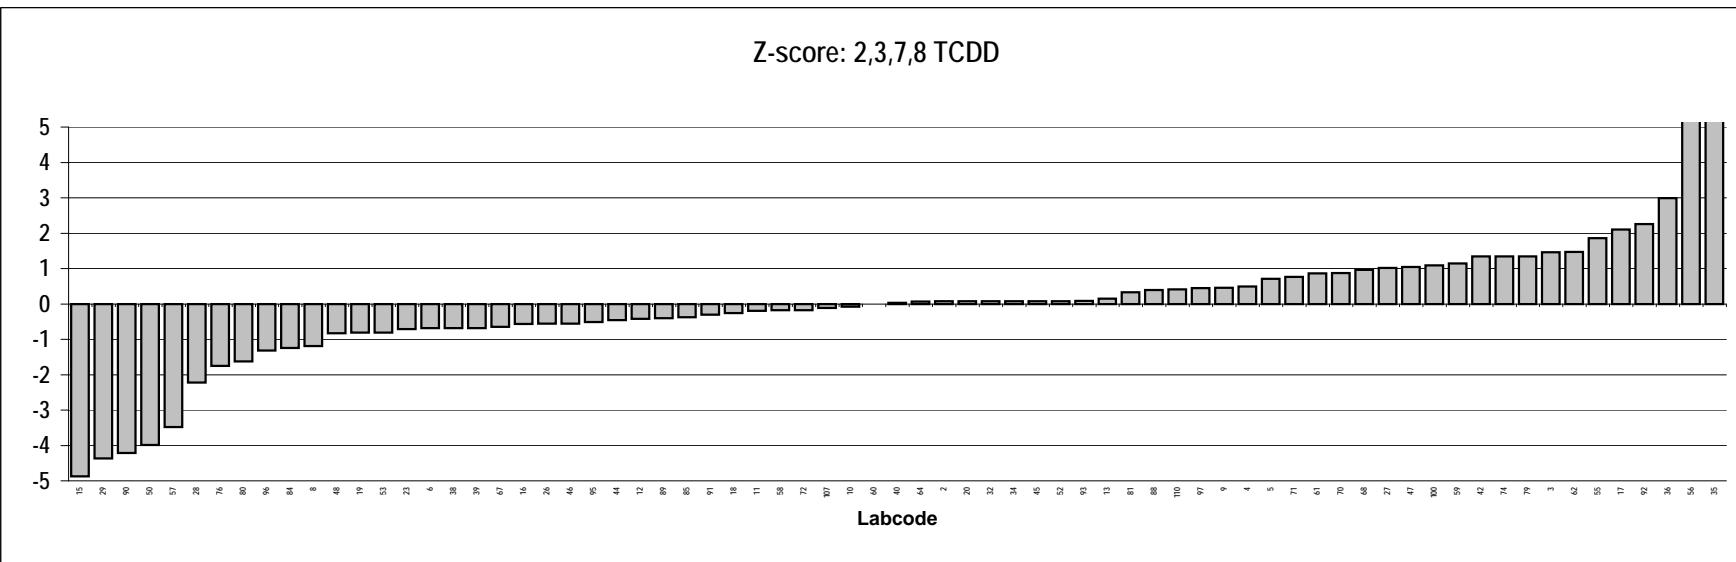

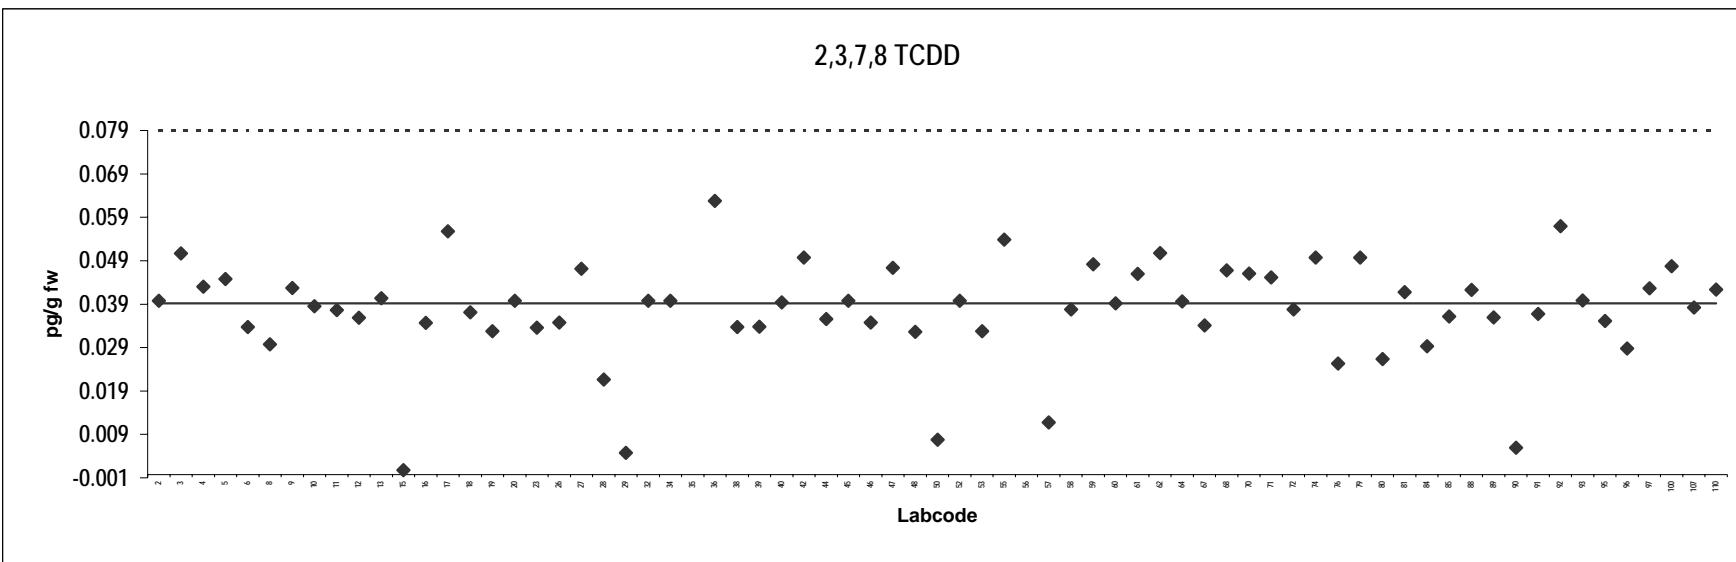

where  $x$  = reported value;  $X$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

## **Appendix 3:**

Presentation of results  
for halibut filet

## Appendix 3: Presentation of results: Halibut fillet

### Statistic calculations for PCDDs, PCDFs and dioxin-like PCBs

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

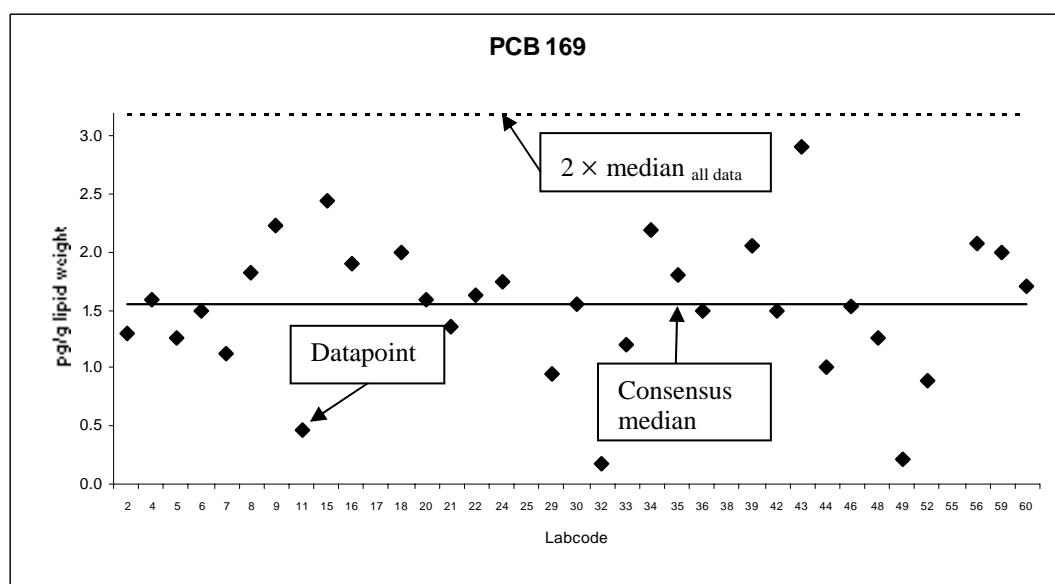

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners.
2. Values exceeding  $2 \times$  this median, were defined as outliers and removed from the data set.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.

### Statistic calculations for indicator PCBs, PBDEs and HBCD

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners (NDs).
2. Values exceeding  $2 \times$  this median, were defined as outliers and removed from the data set. The NDs were also removed.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.
4. For comparison, median, mean and standard deviation were also calculated without removing NDs.

The diagram shows the reported data up to approximately the limit for outliers ( $2 \times$  the first median).

### Z-Scores of individual congeners

Z-scores of each congener were calculated for each laboratory according to the following equation:

$$z = (x - X)/\sigma$$

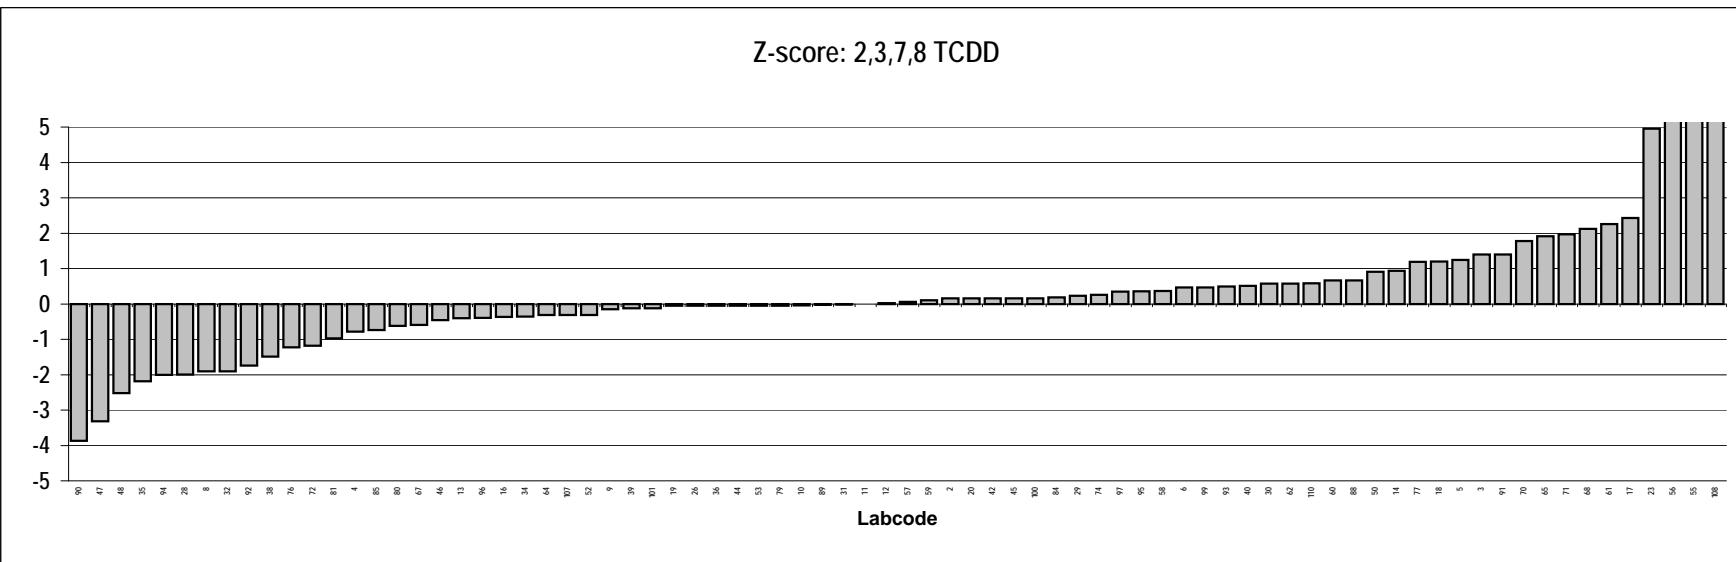

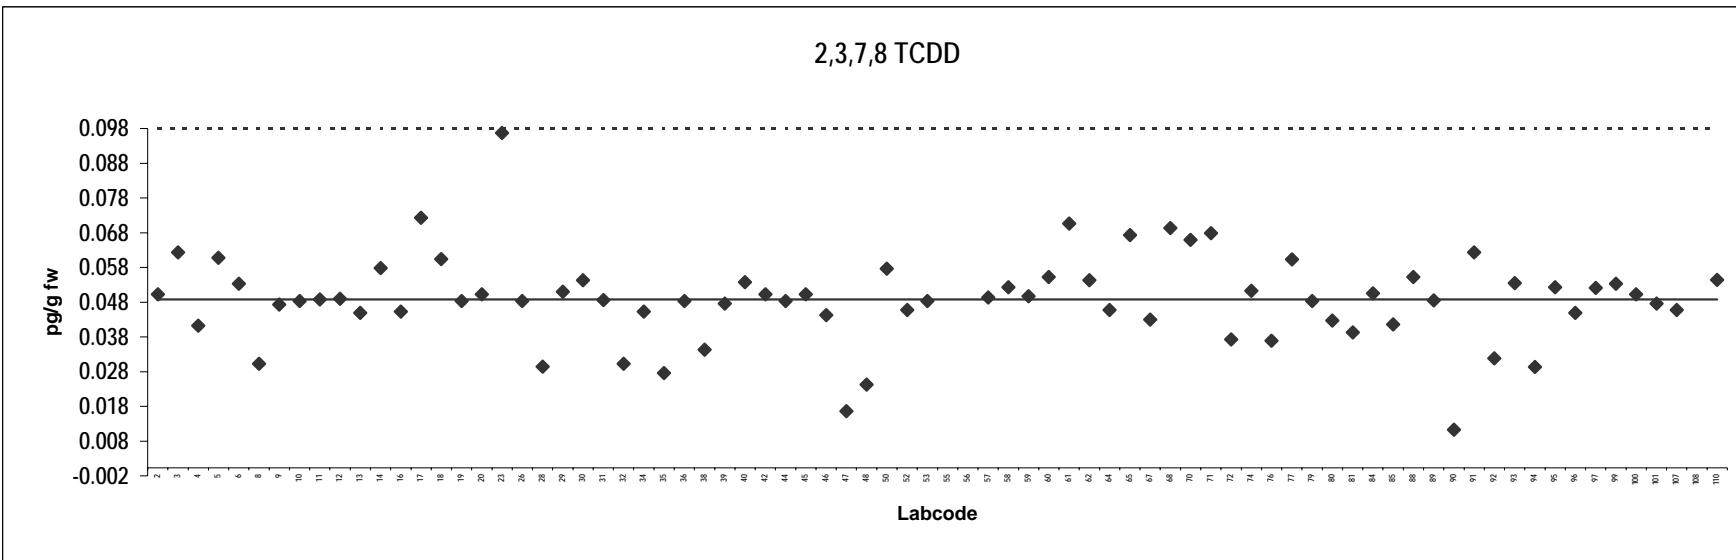

where  $x$  = reported value;  $X$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.

## **Appendix 4:**

Presentation of results  
for cod liver oil

## Appendix 4: Presentation of results: Cod liver oil

### Statistic calculations for PCDDs, PCDFs and dioxin-like PCBs

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

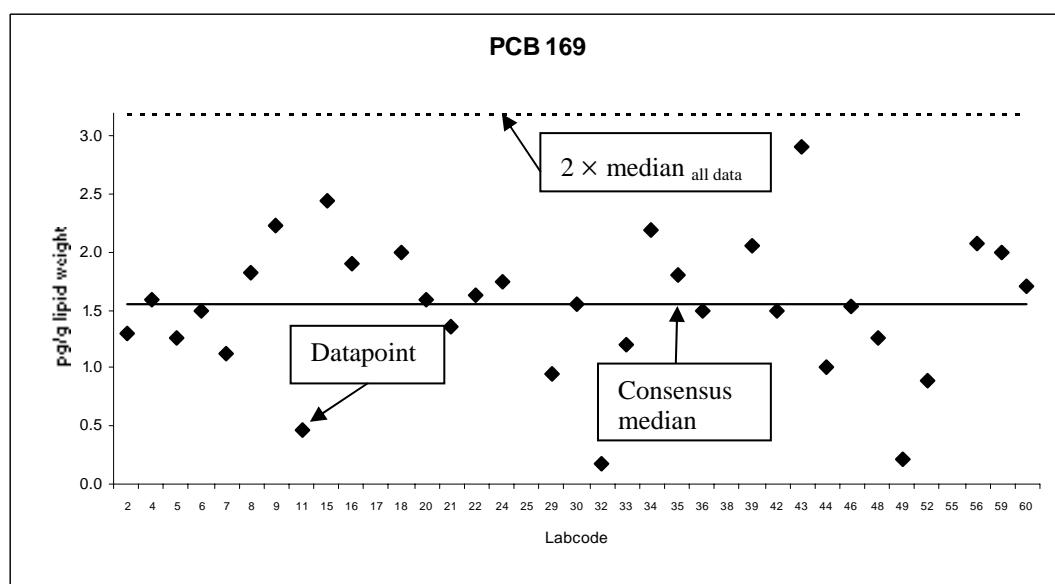

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners.
2. Values exceeding  $2 \times$  this median, were defined as outliers and removed from the data set.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.

### Statistic calculations for indicator PCBs, PBDEs and HBCD

For each congener, the outliers were removed and the consensus calculated according to the following procedure:

1. The median was calculated from all the reported data, using the detection limit as concentration for non-detected congeners (NDs).
2. Values exceeding  $2 \times$  this median, were defined as outliers and removed from the data set. The NDs were also removed.
3. Median, mean and standard deviation were re-calculated from the remaining data. This second median was called consensus.
4. For comparison, median, mean and standard deviation were also calculated without removing NDs.

The diagram shows the reported data up to approximately the limit for outliers ( $2 \times$  the first median).

### Z-Scores of individual congeners

Z-scores of each congener were calculated for each laboratory according to the following equation:

$$z = (x - X)/\sigma$$

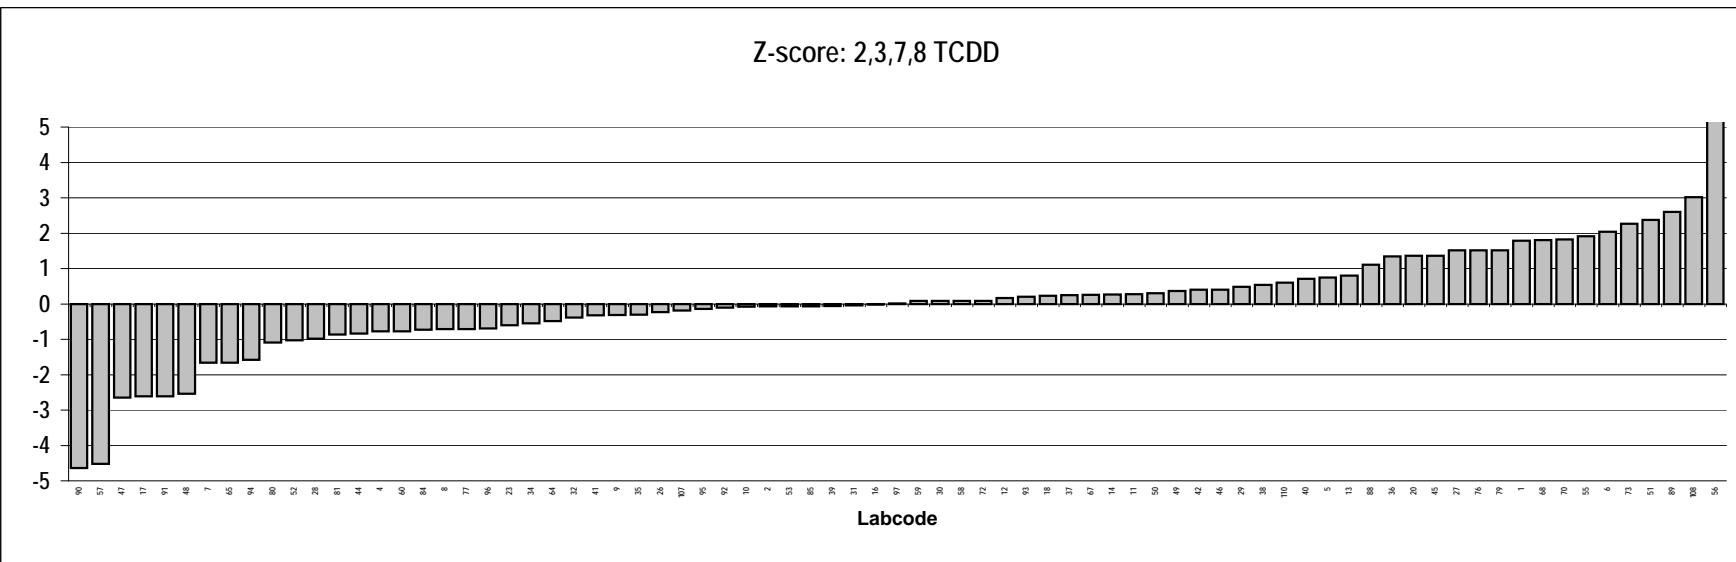

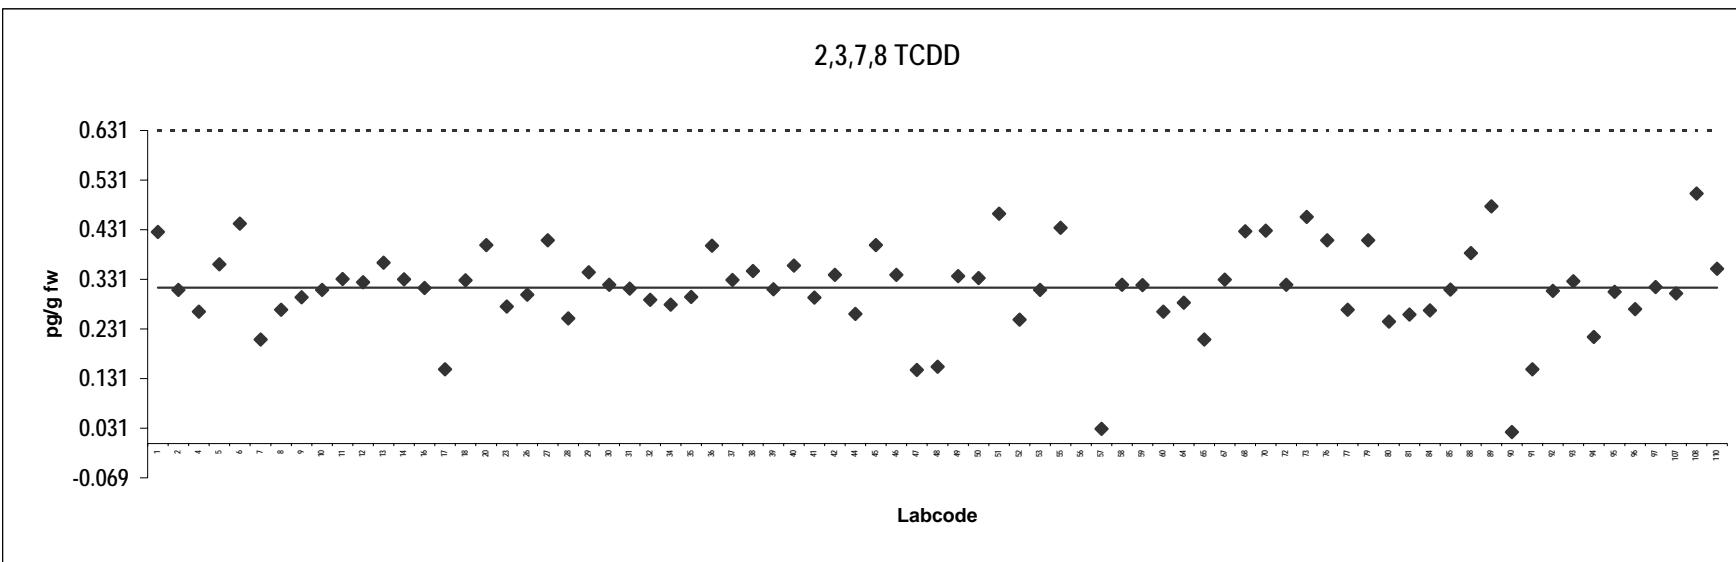

where  $x$  = reported value;  $X$  = assigned value (consensus);  $\sigma$  = target value for standard deviation. A  $\sigma$  of 20% of the consensus was used, i.e. z-scores between +1 and -1 reflect a deviation of  $\pm 20\%$  from the consensus value.
